

Document Title	Specification of Diagnostic Communication Manager
Document Owner	AUTOSAR
Document Responsibility	AUTOSAR
Document Identification No	18

Document Status	published
Part of AUTOSAR Standard	Classic Platform
Part of Standard Release	R20-11

Document Change History			
Date	Release	Changed by	Description
2020-11-30	R20-11	AUTOSAR Release Management	<ul style="list-style-type: none"> • Incorporation of Concept 671 Intrusion Detection System Manager • Added DcmDspExternalSRDataElementClass • Updated the Error Classification chapter • minor corrections / clarifications / editorial changes; For details please refer to the ChangeDocumentation
2019-11-28	R19-11	AUTOSAR Release Management	<ul style="list-style-type: none"> • Incorporation of Concept NVData Handling Enhancements • Incorporation of PeriodicDID Scheduler Type2 • Renaming of the SRS_Diagnostics to RS_Diagnostics • minor corrections / clarifications / editorial changes; For details please refer to the ChangeDocumentation • Changed Document Status from Final to published

2018-10-31	4.4.0	AUTOSAR Release Management	<ul style="list-style-type: none"> • Incorporation of Concept 636 Security Extensions • Rework of SenderReceiver interface support for DIDs: Atomic SenderReceiver interfaces added. • Rework of SenderReceiver interface support for controlling DIDs via service InputOutputControlByIdentifier (0x2F) • Support added for input signals for the RequestRoutineResults (0x03) subfunction of the RoutineControl (0x31) service • minor corrections / clarifications / editorial changes; For details please refer to the ChangeDocumentation
2017-12-08	4.3.1	AUTOSAR Release Management	<ul style="list-style-type: none"> • Cleanup SRS_Diagnostic requirement traceability • Fix Dcm/Dem interactions inconsistencies • Add constraints requirements for parameter configuration • minor corrections / clarifications / editorial changes; For details please refer to the ChangeDocumentation
2016-11-30	4.3.0	AUTOSAR Release Management	<ul style="list-style-type: none"> • Redesign interfaces between Dem and Dcm • Rework Security Access management • Add management for parallel support for OBD and UDS protocols • Clarify usage of Diagnosis scaling • minor corrections / clarifications / editorial changes; For details please refer to the BWCStatement

2015-07-31	4.2.2	AUTOSAR Release Management	<ul style="list-style-type: none"> Specify the NRCs to be sent by the Dcm in case of Dem interfaces return negative values. Clarify Routine operation prototypes Debugging support marked as obsolete Minor corrections / clarifications / editorial changes; For details please refer to the Change Documentation
2014-10-31	4.2.1	AUTOSAR Release Management	<ul style="list-style-type: none"> Update to ISO 14229-1:2013 (Order of NRCS, SID 0x19 and 0x28 extended subfunctions, SID 0x38) Specify security mechanisms (security Lock time, static seed). Refine service ReadDataByPeriodicIdentifier (0x2A) and provide UUDT transfer. Reorganize the configuration parameters for the routines.
2014-03-31	4.1.3	AUTOSAR Release Management	<ul style="list-style-type: none"> Added functional description for DIDRange usage Added support for bootloader interaction Revised the header file structure Editorial changes
2013-10-31	4.1.2	AUTOSAR Release Management	<ul style="list-style-type: none"> Created API tables for service interfaces Provided synchronous and asynchronous APIs for DataServices callouts Harmonization for the length parameter interpretation all over RDBI, WDBI and RC services to be in bytes Editorial changes Removed chapter(s) on change documentation
2013-03-15	4.1.1	AUTOSAR Administration	<ul style="list-style-type: none"> Added Response on Event support Rework configuration for S/R communication Rework OBD Service \$06 management

2011-12-22	4.0.3	AUTOSAR Administration	<ul style="list-style-type: none"> Change interaction with BswM module for mode management Change of callout configuration management for services and sub-services processing Synchronous and asynchronous clarification
2009-12-18	4.0.1	AUTOSAR Administration	<ul style="list-style-type: none"> ComM_DCM_InactiveDiagnostic and ComM_DCM_ActiveDiagnostic has been defined as mandatory interfaces. DcmDslPeriodicTxConfirmationPduld multiplicity changed and creation of DcmDslPeriodicConnection parameter in order to link the confirmation Id with TxPdu Id for PeriodicTransmission. Dem_GetDTCOfOBDFreezeFrame, Dlt_ConditionCheckRead added as optional interfaces DsplInternal_<DiagnosticService> Api moved to mandatory internal interface to support the ECU Supplier diagnosis. Rework of ReadData operation
2009-12-04	3.1.4	AUTOSAR Administration	<ul style="list-style-type: none"> Add support of following UDS services : ReadMemoryByAdress, WriteMemoryByAdress, RequestDownload, RequestUpload, TransferData, RequestTransferExit, CommunicationControl, ResponseOnEvent. Add of bootloader interaction Add of BswM interaction Add of IoHwAb interaction Add of DLT interaction Add of Signal based approach on RTE interfaces Legal invocation revised

2008-08-13	3.1.1	AUTOSAR Administration	<ul style="list-style-type: none"> • Introduction of OBD support • generation of artefacts from the models according to the AUTOSAR process • Identification of requirements and correct formulation of specification items as requirements • General cleanup • Legal invocation revised
2007-12-21	3.0.1	AUTOSAR Administration	<ul style="list-style-type: none"> • Rework of the interfaces with RTE (remove of Central Diagnostic SWC concept) • Correction of issues identified on R2.1 • Document meta information extended • Small layout adaptations made
2007-01-24	2.1.15	AUTOSAR Administration	<ul style="list-style-type: none"> • "Advice for users" revised • "Revision Information" added
	2.1.14	AUTOSAR Administration	<ul style="list-style-type: none"> • Corrections in configuration chapter • Rework on interface between DCM and DEM according to changes in DEM SWS • Corrections in Sequence diagram • Addition of header files inclusions • Legal disclaimer revised
2006-11-28	2.1	AUTOSAR Administration	<ul style="list-style-type: none"> • Layout Adaptations
2006-05-16	2.0	AUTOSAR Administration	<ul style="list-style-type: none"> • Document structure adapted to common Release 2.0 SWS Template • Major changes in chapter 10 • Structure of document changed partly • Other changes see chapter 11
2005-05-31	1.0	AUTOSAR Administration	<ul style="list-style-type: none"> • Initial release

Table of Contents

1	Introduction and functional overview	22
2	Acronyms and Abbreviations	24
2.1	Typographical Conventions	26
3	Related documentation	26
3.1	Input documents & related standards and norms	26
3.2	Related specification	27
4	Constraints and assumptions	27
4.1	Limitations	27
4.2	Applicability to car domains	29
4.3	Applicability to emission-related environments (OBD)	29
5	Dependencies to other modules	30
6	Requirements Tracing	31
7	Functional specification	46
7.1	Security Events	46
7.2	Error Classification	47
7.2.1	Development Errors	47
7.2.2	Runtime Errors	48
7.2.3	Transient Faults	48
7.2.4	Production Errors	48
7.2.5	Extended Production Errors	48
7.3	General design elements	49
7.3.1	Submodules within the <code>Dcm</code> module	49
7.3.2	Negative Response Code (NRC)	50
7.3.3	Non-volatile information	50
7.3.4	Types	50
7.3.4.1	Atomic types overview	51
7.3.4.2	Data array types overview	51
7.3.4.3	Data types constraints	51
7.3.4.4	<code>Dcm_OpStatusType</code>	52
7.3.4.5	<code>Dcm_Cemr_{DID}Type</code>	53
7.4	Diagnostic Session Layer (DSL)	53
7.4.1	Introduction	53
7.4.2	Use cases	53
7.4.3	Interaction with other modules	53
7.4.4	Functional description	54
7.4.4.1	Overview	54
7.4.4.2	Forward requests from the <code>PduR</code> module to the <code>DSD</code> submodule	55
7.4.4.2.1	<code>Dcm_StartOfReception</code>	56

7.4.4.2.2	Dcm_CopyRxData	57
7.4.4.2.3	Dcm_TpRxIndication	57
7.4.4.3	Concurrent TesterPresent ("keep alive logic")	58
7.4.4.3.1	Dcm_CopyTxData	58
7.4.4.3.2	Dcm_TpTxConfirmation	59
7.4.4.4	Forward responses from the DSD submodule to the PduR module	59
7.4.4.5	Generic Connection Handling	60
7.4.4.6	Guarantee timing to tester by sending busy responses	61
7.4.4.7	Support of periodic transmission	62
7.4.4.8	Support of ROE transmission	62
7.4.4.8.1	ResponseOnEvent StateChar	63
7.4.4.8.1.1	Initializing Dcm (1)	63
7.4.4.8.1.2	Transition from 'ROE cleared' to 'ROE stopped' (2)	63
7.4.4.8.1.3	Transition from 'ROE stopped' to 'ROE cleared' (3)	64
7.4.4.8.1.4	Transition from 'ROE stopped' to 'ROE started' (4)	64
7.4.4.8.1.5	Transition from 'ROE started' to 'ROE stopped' (5)	64
7.4.4.8.1.6	Transition from 'ROE started' to 'ROE started' (6)	65
7.4.4.8.1.7	Transition from 'ROE started' to 'ROE cleared' (7)	65
7.4.4.8.1.8	Transition from 'ROE cleared' to 'ROE cleared' (8)	65
7.4.4.8.1.9	Transition from 'ROE cleared' to 'ROE started' (9)	65
7.4.4.8.1.10	Transition from 'ROE stopped' to 'ROE stopped' (10)	66
7.4.4.8.2	ROE sub-functions	66
7.4.4.8.3	EventWindowTime and StorageState	66
7.4.4.8.4	Pre-configuration of ResponseOnEvent	68
7.4.4.8.5	Handling of event-trigger	69
7.4.4.8.5.1	ROE event-trigger onDTCStatusChange (0x01)	69
7.4.4.8.5.2	ROE event-trigger onChangeOfDataIdentifier (0x03)	70
7.4.4.8.6	Trigger a ServiceToRespondTo	70
7.4.4.8.7	Send a ServiceToRespondTo	71
7.4.4.8.7.1	Roe transmission cycle	72
7.4.4.8.8	ResponseOnEvent in multiple client environments	72
7.4.4.9	Support of segmented response (paged-buffer)	72

7.4.4.10	Support of ResponsePending response triggered by the Application	73
7.4.4.11	Manage security level	73
	7.4.4.11.1 Initialization sequence	74
	7.4.4.11.2 AttemptCounter update	75
7.4.4.12	Manage session state	76
7.4.4.13	Manage authentication state	76
7.4.4.14	Keep track of active non-default sessions	78
7.4.4.15	Allow to modify timings	79
7.4.4.16	Handling of different diagnostic protocols	80
	7.4.4.16.1 Different service tables	80
	7.4.4.16.2 Prioritization of protocol	80
	7.4.4.16.3 Preemption of protocol	81
	7.4.4.16.4 Parallel OBD and UDS protocol processing	82
	7.4.4.16.5 Detection of protocol start	83
	7.4.4.16.6 Protocol stop	84
7.4.4.17	Manage resources	84
7.4.4.18	Communication Mode Handling	85
	7.4.4.18.1 No Communication	85
	7.4.4.18.2 Silent Communication	86
	7.4.4.18.3 Full Communication	86
	7.4.4.18.4 Diagnostic Activation State	87
7.5	Diagnostic Service Dispatcher (DSD)	88
7.5.1	Introduction	88
7.5.2	Use cases	88
	7.5.2.1 Receive a request message and transmit a positive response message	89
	7.5.2.2 Receive a request message and suppress a positive response	89
	7.5.2.3 Receive a request message and suppress a negative response	89
	7.5.2.4 Receive a request message and transmit a negative response message	89
	7.5.2.5 Send a positive response message without corresponding request	90
	7.5.2.6 Segmented Responses (paged-buffer)	91
7.5.3	Interaction of the DSD with other modules	91
	7.5.3.1 Interaction of the DSD with the DSL main functionality	91
	7.5.3.2 Interaction of the DSD with the DSP	91
7.5.4	Functional Description of the DSD	92
	7.5.4.1 Support checking the diagnostic service identifier and adapting the diagnostic message	92
	7.5.4.2 Handling of "suppressPosRspMsgIndicationBit"	93
	7.5.4.3 Verification functionality	94
	7.5.4.3.1 Verification of the diagnostic service access rights	95

7.5.4.3.2	Verification of the Diagnostic Session	96
7.5.4.3.3	Verification of the Service Security Access levels	97
7.5.4.3.4	Verification of the Service mode dependencies	98
7.5.4.4	Check format and subfunction support	98
7.5.4.4.1	Verification of the Manufacturer Application environment/permission	98
7.5.4.4.2	Verification of the Supplier Application environment/permission	99
7.5.4.5	Distribution of diagnostic message to DSP submodule	100
7.5.4.6	Assemble positive or negative response	100
7.5.4.6.1	Positive Response	100
7.5.4.6.2	Negative Response	100
7.5.4.6.3	Suppression of response	101
7.5.4.7	Initiate transmission	101
7.6	Diagnostic Service Processing (DSP)	102
7.6.1	General	102
7.6.1.1	Check format and subfunction support	103
7.6.1.2	Assemble response	103
7.6.1.3	Negative Response Codes handling	103
7.6.1.4	Diagnostic mode declaration groups	104
7.6.1.5	Environmental condition dependent execution	105
7.6.1.6	Sender/Receiver Communication	108
7.6.1.7	Passing SwDataDefProps properties from DEXT file to the Dcm Service SW-C	109
7.6.1.7.1	DcmDspDiagnosticDataElementRef workflow	109
7.6.1.7.2	DcmDspAlternativeDataType.DcmApplicationDataType workflow	110
7.6.1.8	Asynchronous call behavior	110
7.6.2	UDS Services	111
7.6.2.1	General behavior using DEM interfaces	112
7.6.2.2	Service 0x10 - Diagnostic Session Control	114
7.6.2.3	Service 0x11 - ECURestart	114
7.6.2.4	Service 0x14 - Clear Diagnostic Information	115
7.6.2.5	Service 0x19 - Read DTC Information	117
7.6.2.5.1	Subfunctions 0x01, 0x07, 0x11 and 0x12	117
7.6.2.5.2	Subfunctions 0x02, 0x0A, 0x0F, 0x13, 0x15 and 0x17	118
7.6.2.5.3	Subfunction 0x08	121
7.6.2.5.4	Subfunction 0x09	122
7.6.2.5.5	Subfunctions 0x06/0x10/0x19	123
7.6.2.5.6	Subfunction 0x03	125
7.6.2.5.7	Subfunctions 0x04 and 0x18	127
7.6.2.5.8	Subfunction 0x05	129
7.6.2.5.9	Subfunctions 0x0B, 0x0C, 0x0D and 0x0E	130
7.6.2.5.10	Subfunction 0x14	131

7.6.2.5.11	Subfunction 0x42	132
7.6.2.5.12	Subfunction 0x55	134
7.6.2.6	Service 0x22 - ReadDataByIdentifier	135
7.6.2.6.1	UDS DID	138
7.6.2.6.2	OBD DID	140
7.6.2.7	Service 0x24 - ReadScalingDataByIdentifier	141
7.6.2.8	Service 0x27 - SecurityAccess	142
7.6.2.9	Service 0x28 - CommunicationControl	144
7.6.2.10	Service 0x29 - Authentication	147
7.6.2.10.1	De-authentication	149
7.6.2.10.2	Verify Certificates	149
7.6.2.10.3	Proof of ownership client	154
7.6.2.10.4	Definition and verification of roles	156
7.6.2.10.5	Definition and verification of white lists	157
7.6.2.10.6	AuthenticationConfiguration	160
7.6.2.11	Service 0x2A - ReadDataByPeriodicIdentifier	160
7.6.2.11.1	Scheduler PeriodicTransmission	163
7.6.2.12	Service 0x2C - DynamicallyDefineDataIdentifier	172
7.6.2.13	Service 0x2E - WriteDataByIdentifier	174
7.6.2.14	Service 0x2F - InputOutputControlByIdentifier	177
7.6.2.15	Service 0x31 - RoutineControl	188
7.6.2.16	Service 0x3E - Tester Present	196
7.6.2.17	Service 0x3D - WriteMemoryByAddress	196
7.6.2.18	Service 0x23 - ReadMemoryByAddress	198
7.6.2.19	Service 0x34 - RequestDownload	199
7.6.2.20	Service 0x35 - RequestUpload	200
7.6.2.21	Service 0x36 - TransferData	201
7.6.2.22	Service 0x37 - RequestTransferExit	203
7.6.2.23	Service 0x38 - RequestFileTransfer	203
7.6.2.24	Service 0x85 - ControlDTCSetting	205
7.6.2.25	Service 0x87 - LinkControl	206
7.6.3	OBD Services	206
7.6.3.1	Overview	206
7.6.3.2	General behavior	207
7.6.3.3	Service \$01 - Request Current Powertrain Diagnostic Data	208
7.6.3.4	Service \$02 - Request Power Train FreezeFrame Data	210
7.6.3.4.1	Service \$02 - PID\$02	211
7.6.3.4.2	Service \$02 - availability PID	211
7.6.3.4.3	Service \$02 - other PIDs	211
7.6.3.5	Service \$03 \$07 \$0A - Obtaining DTCs	212
7.6.3.6	Service \$04 - Clear/reset emission-related diagnostic information	214
7.6.3.7	Service \$06 - Request On-Board Monitoring Test-results for Specific Monitored Systems	215
7.6.3.7.1	General requirements	215

7.6.3.7.2	Test results obtained via <code>Dem</code> interaction	215
7.6.3.8	Service \$08 - Request Control of On-Board System, Test or Component	216
7.6.3.9	Service \$09 - Request Vehicle Information	217
7.6.4	Interaction usecases	218
7.6.4.1	Jump to Bootloader	218
7.6.4.2	Jump due to ECURestart	221
7.6.4.3	Jump from Bootloader / ECURestart	221
7.6.4.4	Flags management	222
7.6.4.4.1	Jump to Bootloader	222
7.6.4.4.2	Jump from Bootloader	222
7.7	Error notification	223
7.8	Synchronous and Asynchronous implementation	223
7.9	DID configuration	224
7.9.1	Individual DID	224
7.9.2	DID ranges	226
7.10	Startup behavior	227
8	API specification	227
8.1	Imported types	227
8.2	Type definitions	228
8.2.1	<code>Dcm_StatusType</code>	228
8.2.2	<code>Dcm_CommunicationModeType</code>	229
8.2.3	<code>Dcm_ConfigType</code>	230
8.2.4	<code>Dcm_ReturnReadMemoryType</code>	230
8.2.5	<code>Dcm_ReturnWriteMemoryType</code>	230
8.2.6	<code>Dcm_EcuStartModeType</code>	231
8.2.7	<code>Dcm_ProgConditionsType</code>	231
8.2.8	<code>Dcm_MsgItemType</code>	232
8.2.9	<code>Dcm_MsgType</code>	232
8.2.10	<code>Dcm_MsgLenType</code>	233
8.2.11	<code>Dcm_MsgAddInfoType</code>	233
8.2.12	<code>Dcm_IdContextType</code>	234
8.2.13	<code>Dcm_MsgContextType</code>	234
8.2.14	<code>Dcm_ExtendedOpStatusType</code>	235
8.3	Function definitions	236
8.3.1	Functions provided for other BSW components	236
8.3.1.1	<code>Dcm_Init</code>	236
8.3.1.2	<code>Dcm_GetVersionInfo</code>	237
8.3.1.3	<code>Dcm_DemTriggerOnDTCStatus</code>	237
8.3.1.4	<code>Dcm_GetVin</code>	238
8.3.1.5	<code>Dcm_BndMWriteBlockFinish</code>	238
8.3.2	Functions provided to BSW modules and to SW-Cs	239
8.3.2.1	<code>Dcm_SetDeauthenticatedRole</code>	239
8.3.2.2	<code>Dcm_GetSecurityLevel</code>	239
8.3.2.3	<code>Dcm_GetSesCtrlType</code>	240

8.3.2.4	Dcm_GetActiveProtocol	240
8.3.2.5	Dcm_ResetToDefaultSession	241
8.3.2.6	Dcm_TriggerOnEvent	241
8.3.2.7	Dcm_SetActiveDiagnostic	242
8.4	Callback notifications	242
8.4.1	Dcm_StartOfReception	243
8.4.2	Dcm_CopyRxData	244
8.4.3	Dcm_TpRxIndication	245
8.4.4	Dcm_CopyTxData	245
8.4.5	Dcm_TpTxConfirmation	247
8.4.6	Dcm_TxConfirmation	247
8.4.7	Dcm_ComM_NoComModeEntered	248
8.4.8	Dcm_ComM_SilentComModeEntered	248
8.4.9	Dcm_ComM_FullComModeEntered	248

8.4.11	Dcm_KeyMAsyncCertificateVerifyFinished	249
8.5	Callout Definitions	250
8.5.1	Dcm_ReadMemory	250
8.5.2	Dcm_WriteMemory	251
8.5.3	Dcm_SetProgConditions	252
8.5.4	Dcm_GetProgConditions	253
8.5.5	Dcm_ProcessRequestAddFile	254
8.5.6	Dcm_ProcessRequestDeleteFile	255
8.5.7	Dcm_ProcessRequestReplaceFile	256
8.5.8	Dcm_ProcessRequestReadFile	257
8.5.9	Dcm_ProcessRequestReadDir	258
8.5.10	Dcm_WriteFile	259
8.5.11	Dcm_ReadFileOrDir	260
8.6	Scheduled functions	260
8.6.1	Dcm_MainFunction	260
8.7	Expected interfaces	261
8.7.1	Mandatory interfaces	261
8.7.2	Optional interfaces	261
8.7.3	Configurable interfaces	265
8.7.3.1	SecurityAccess	265
8.7.3.1.1	GetSeed	265
8.7.3.1.2	CompareKey	266
8.7.3.1.3	GetSecurityAttemptCounter	267
8.7.3.1.4	SetSecurityAttemptCounter	268
8.7.3.2	DataServices	268
8.7.3.2.1	ReadData	268
8.7.3.2.2	WriteData	270
8.7.3.2.3	ReadDataLength	273
8.7.3.2.4	ConditionCheckRead	274
8.7.3.2.5	GetScalingInformation	275
8.7.3.2.6	ReturnControlToECU	276

8.7.3.2.7	ResetToDefault	277
8.7.3.2.7.1	Synchronous interface	277
8.7.3.2.7.2	Asynchronous interface	278
8.7.3.2.8	FreezeCurrentState	279
8.7.3.2.8.1	Synchronous interface	279
8.7.3.2.8.2	Asynchronous interface	280
8.7.3.2.9	ShortTermAdjustment	281
8.7.3.2.9.1	Synchronous interface	281
8.7.3.2.9.2	Asynchronous interface	282
8.7.3.3	DataServices_DIDRange	284
8.7.3.3.1	IsDidAvailable	284
8.7.3.3.2	ReadDidData	284

1 Introduction and functional overview

The [Dcm](#) SWS describes the functionality, the API, and the configuration of the AUTOSAR Basic Software module [Dcm](#) (Diagnostic Communication Manager). The [Dcm](#) module provides a common [API](#) for diagnostic services. The functionality of the [Dcm](#) module is used by external diagnostic tools during the development, manufacturing or service.

Figure 1.1: Overview of the communication between the external diagnostic tools and the onboard AUTOSAR Application

The [Dcm](#) module ensures diagnostic data flow and manages the diagnostic states, especially diagnostic sessions and security states. Furthermore, the [Dcm](#) module checks if the diagnostic service request is supported and if the service may be executed in the current session according to the diagnostic states. The [Dcm](#) module provides the OSI-Layers 5 to 7 of Table 1: Diagnostic protocols and OSI-Layer.

OSI-Layer	Protocols				
7	UDS-Protocol - ISO14229-1 [1]				
6	-	-	-	-	-
5	ISO15765-3	-	-	-	ISO 15765-4
4	ISO15765-2	-	-	-	-
3	ISO15765-2	-	-	-	ISO 15765-4
2	CAN-Protocol	LIN-Protocol	FlexRay	MOST	ISO 15765-4
1	CAN-Protocol	LIN-Protocol	FlexRay	MOST	ISO 15765-4

Table 1.1: Diagnostic protocols and OSI-Layers

At OSI-level 7, the [Dcm](#) module provides an extensive set of ISO14229-1 [1] services. In addition, the [Dcm](#) module provides mechanisms to support the [OBD](#) services \$01 -

\$0A defined in documents [3, SAE J1979] and [2, ISO 15031-5]. With these services, Autosar **OBD** functionality is capable of meeting all light duty **OBD** regulations worldwide (California OBDII, EOBD, Japan OBD, and all others). At OSI-level 5, the **Dcm** module handles the network-independent sections of the following specifications:

- ISO15765-3 [4]: Implementation of unified diagnostic services (UDS on CAN)
- ISO15765-4 [5]: Requirements for emission-related systems, Chapter 5 "Session Layer"

In the AUTOSAR Architecture the Diagnostic Communication Manager is located in the Communication Services (Service Layer).

Figure 1.2: Position of the **Dcm** module in AUTOSAR Architecture

The **Dcm** module is network-independent. All network-specific functionality (the specifics of networks like CAN, LIN, FlexRay or MOST) is handled outside of the **Dcm** module. The PDU Router (PduR) module provides a network-independent interface to the **Dcm** module. The **Dcm** module receives a diagnostic message from the PduR module. The **Dcm** module processes and checks internally the diagnostic message. As part of processing the requested diagnostic service, the **Dcm** will interact with other BSW modules or with SW-Components (through the RTE) to obtain requested data or to execute requested commands. This processing is very service-specific. Typically, the **Dcm** will assemble the gathered information and send a message back through the PduR module.

2 Acronyms and Abbreviations

The glossary below includes acronyms and abbreviations relevant to the <MODULE_NAME> module that are not included in the [6, AUTOSAR glossary].

Abbreviation / Acronym:	Description:
Application Layer	The Application Layer is placed above the RTE. Within the Application Layer the AUTOSAR Software-Components are placed.
Atomic Sender/Receiver interface	An atomic sender-receiver interface can be used to group DID data elements into one record data element prototype. All data elements can be read or write having a single read or write operation.
Channel	A link at which a data transfer can take place. If there is more than one Channel, there is normally some kind of ID assigned to the Channel.
Concurrent TesterPresent	A UDS service TesterPresent with set suppressPosRspMsgIndicationBit (3E 80) which is received with functional addressing. It is also known as keep-alive logic..
Diagnostic Channel	A link at which a data transfer between a diagnostic tool and an ECU can take place. Example: An ECU is connected via CAN and the diagnostic channel has an assigned CAN-ID. Diagnostic channels connected to other bus-systems such as MOST, FlexRay, LIN, etc. are also possible.
External Diagnostic Tool	A device which is NOT permanently connected to the vehicle communication network. This External Diagnostic Tool can be connected to the vehicle for various purposes, as e.g. for: <ul style="list-style-type: none"> • development • manufacturing • service (in a garage) Example External Diagnostic Tools are: <ul style="list-style-type: none"> • a diagnostic tester • an OBD scan tool The External Diagnostic Tool is to be connected by a mechanic to gather information from "inside" the car.
Freeze Frame	A set of the vehicle/system operation conditions at a specific time.
Functional Addressing	The diagnostic communication model where a group or all nodes of a specific communication network receive a message from one sending node (1-n communication). This model is also referred to as 'broadcast' or 'multicast'. OBD communication will always be done in the Functional Addressing mode.
Internal Diagnostic Tool	A device/ECU which is connected to the vehicle communication network. The Internal Diagnostic Tool can be used for: <ul style="list-style-type: none"> • advanced event tracking • advanced analysis • for service The behavior of the Internal Diagnostic Tool can be the same as of an External Diagnostic Tool. The notion of "Internal Diagnostic Tool" does not imply that it is included in each ECU as an AUTOSAR Software-Component.

Abbreviation / Acronym:	Description:
Physical Addressing	The diagnostic communication model where a node of a specific communication network receives a message from one sending node (1-1 communication). This model is also referred to as 'unicast'.
UDS Service	this refers to a UDS Service as defined in ISO14229-1 [1].
OBD Service	This refers to an OBD Service as defined in ISO15031-5 [2].
AddressAndLengthFormat Identifier	Defines the number of bytes used for the memoryAddress and memorySize parameter in the request messages.
OBD Scan tool	See definition External Diagnostic Tool.
periodic transmission rate	Time interval value that defines the time between two calls of a periodic data identifier transmission. The value is configuration specific and there are separate values for fast, medium and slow periodic data transmission. The configured value is always an integer multiple of the Dcm main task time.

Terms:	Description:
API	Application Programming Interface
CAN	Controller Area Network
CEMR	ControlEnableMaskRecord
Dcm	Diagnostic Communication Manager
Dem	Diagnostic Event Manager
Det	Default Error Tracer
DID	Data Identifier
DSD	Diagnostic Service Dispatcher (submodule of the Dcm module)
DSL	Diagnostic Session Layer (submodule of the Dcm module)
DSP	Diagnostic Service Processing (submodule of the Dcm module)
DTC	Diagnostic Trouble Codes
ID	Identifier
LIN	Local Interconnect Network
MCU	Micro-Controller Unit
MOST	Media Orientated System Transport
NRC	Negative Response Code
OBD	On-Board Diagnosis
OSI	Open Systems Interconnection
PDID	Periodic Data Identifier, periodically send by the Dcm after a request of ReadDataByPeriodicIdentifier
PDU	Protocol Data Unit
PID	Parameter Identifier
RCRRP	Response correctly received - response pending
RID	Routine Identifier
ROE	ResponseOnEvent
RTE	Runtime Environment
SAP	Service Access Point
SDU	Service Data Unit
SID	Service Identifier
SW-C	Software-Component
TP	Transport Protocol
UDS	Unified Diagnostic Services
Xxx_	Placeholder for an API provider
SPRMIB	suppressPosRspMsgIndicationBit

2.1 Typographical Conventions

This document uses the following typographical conventions:

- see configuration parameter myConfigurationParameter: this is a reference to a configuration parameter which can be found in Chapter 10.
- myFunction(): this is a function provided or required by the module as defined in Chapter 8

3.2 Related specification

AUTOSAR provides a General Specification on Basic Software modules [7, SWS BSW General] , which is also valid for Diagnostic Communication Manager.

Thus, the specification SWS BSW General shall be considered as additional and required specification for Diagnostic Communication Manager.

4 Constraints and assumptions

4.1 Limitations

The following limitations apply when using the [Dcm](#) module:

- The [Dcm](#) module does not provide any diagnostic multi-channel capabilities. This means that parallel requests of a tester addressed to different independent functionalities cannot be processed by a single [Dcm](#) module. Furthermore, the concept currently implemented does not take more than one instance of a [Dcm](#) module residing in one ECU into account. As the legislator requires that emission-related service requests according to ISO 15031-5 [2] shall be processed prior to any enhanced diagnostic requests, the [Dcm](#) module provides a protocol switching mechanism based on protocol prioritization.
- [UDS](#) Service AccessTimingParameter (0x83) is not supported by the ISO standards in [CAN](#) and [LIN](#). Also it is not planned to support this service with [FlexRay](#). Therefore no support for this service is planned.

- Subfunction onComparisionOfValues of Service ResponseOnEvent is not supported in the current release.
- Subfunction onTimerInterrupt of Service ResponseOnEvent is not supported in the current release.
- [UDS](#) Service SecuredDataTransmission (0x84) is not supported in the current release.
- The [Dcm](#) SWS does not cover any SAE J1939 related diagnostic requirements.
- Due to DEM limitation, the diagnostic service \$19 05 is limited to the OBD legislative freeze frame.
- Management of IOControl service without InputOutputControlParameter in request and response is not supported
- The length of controlState parameter in IOControl request and response has to be of same size (due to the one configuration parameter [DcmDspDataByteSize](#))
- Same layout of a [DID](#) which is used in RDBI, WDBI or IOCBI services
- The user optional parameter DTCSettingControlOptionRecord in the ControlDTCSetting request is only supported if it corresponds to a groupOfAllDTCs (0xFFFFFFF) value. In other cases it has to be managed in a vendor specific implementation.
- Only the ControlDTCSetting sub-functions 0x01 and 0x02 are supported.
- The handling of infrastructure errors reported by the [RTE](#) during DCM/DEM <-> [SW-C](#) interactions is missing from the SWS and might have to be taken into account by implementers if they need it.
- The [Dcm](#) does not support DLT for [ROE](#)
- The [ROE](#) ServiceToRespondTo does not support PageBuffering
- [ROE](#) only supports sub-function listed in Table 2
- [DID](#) range feature cannot be applied for services DynamicallyDefineDataIdentifier, ReadDataByPeriodicIdentifier and InputOutputControlById
- AUTOSAR [Dcm](#) is not intended to be used in the bootloader
- PeriodicTransmission is not possible on FlexRay, as ISO 14229-4 demands header information (address information (source and target address) and FPL (Frame Payload length)). This information can't be filled with the specified concept of IF interface.
- The specification of the transformer for intra ecu communication between the [Dcm](#) module and the NvBlockSoftwareComponentType is not standardized in the current AUTOSAR release. For this scenario custom transformers implemented by a complex driver can be used. To elaborate on this the responsible stakeholder (usually the OEM) needs to specify the custom transformer from a behavioral

point of view in a separate document (this might include definition of byte-ordering or alignment). If there is the necessity to define transformer specific attributes in the model this can be done using special data groups in `UserDefinedTransformationDescription` and `UserDefinedTransformationISignalProps`. For the configuration of this scenario, a `DataPrototypeMapping` shall exist for the affected `Sender-ReceiverInterfaces` of the `Dcm` module and the `NvBlockSoftwareComponentType` which refers to a `DataTransformation` in the role `firstToSecondDataTransformation`. This `DataTransformation` shall reference exactly one `TransformationTechnology` in the role `transformerChain` with the `transformerClass` attribute set to "serializer" and may compose a `UserDefinedTransformationDescription` in the role `transformationDescription`.

- In certain situations the `Dcm` module is capable to process diagnostic requests in parallel. This possibility is explicitly limited of OBD in parallel to UDS protocol processing. No other protocol combination can be processed in parallel. Particularly the use case of parallel processing of two or more UDS protocol requests or WWH-OBD and UDS protocols is not supported.
- For UDS service 0x29, the `Dcm` supports only the sub-functions for PKI. Authentication via challenge response is not supported.
- For UDS service 0x29, secure diagnostic communication with Diffie-Hellmann key exchange is not supported.
- For UDS service 0x29 the `Dcm` does not support `NRC` 'Certificate verification failed - Invalid Content'.

4.2 Applicability to car domains

The `Dcm` module can be used for all car domains.

4.3 Applicability to emission-related environments (OBD)

This `Dcm` SWS is intended to fulfill the emission related requirements given by legislator. However, the supplier of the emission related system is responsible to fulfill the `OBD` requirements. Certain requirements cannot be fulfilled by the `Dcm` module by itself, but need to be considered at the level of the entire ECU or system. Example: During the integration of the `Dcm` module within the system, the timing requirements (50ms response time) must be fulfilled.

For WWH-OBD only the FunctionalGroupIdentifier 0x33 is currently supported.

5 Dependencies to other modules

The AUTOSAR Diagnostic Communication Manager (DCM) has interfaces and dependencies to the following Basic Software modules and SW-Cs:

Figure 5.1: Interaction of the **Dcm** with other modules

- Diagnostic Event Manager (DEM): The DEM module provides function to retrieve all information related to fault memory such that the **Dcm** module is able to respond to tester requests by reading data from the fault memory.
- Protocol Data Unit Router (PduR module): The PduR module provides functions to transmit and receive diagnostic data. Proper operation of the **Dcm** module presumes that the PduR interface supports all service primitives defined for the Service Access Point (SAP) between diagnostic application layer and underlying transport layer (see ISO14229-1 [1], chapter 5 Application layer services).
- Communication Manager (ComM): The ComM module provides functions such that the **Dcm** module can indicate the states "active" and "inactive" for diagnostic

communication. The [Dcm](#) module provides functionality to handle the communication requirements "Full-/ Silent-/ No-Communication". Additionally, the [Dcm](#) module provides the functionality to enable and disable Diagnostic Communication if requested by the ComM module.

- [SW-C](#) and RTE: The [Dcm](#) module has the capability to analyze the received diagnostic request data stream and handles all functionalities related to diagnostic communication such as protocol handling and timing. Based on the analysis of the request data stream the [Dcm](#) module assembles the response data stream and delegates routines or IO-Control executions to SW-Cs .If any of the data elements or functional states cannot be provided by the [Dcm](#) module itself the [Dcm](#) requests data or functional states from SW-Cs via port-interfaces or from other BSW modules through direct function-calls.
- BswM: The [Dcm](#) notifies the BswM that the application was updated if the initialization of the [Dcm](#) is the consequence of a jump from the bootloader . The [Dcm](#) also indicates to the BswM a communication mode change.
- Crypto Service Manager (Csm): The crypto service module provides a wide range of cryptographic algorithms. The Csm is used for authentication calculation.
- Key Manager (KeyM): The key manager module provides support for certificate handling and APIs to realize authenticated diagnostics via certificates.

6 Requirements Tracing

The following tables reference the requirements specified in AUTOSAR_RS_RSDiagnostics as well as [8] and links to the fulfillment of these. Please note that if column "Satisfied by" is empty for a specific requirement this means that this requirement is not fulfilled by this document.

Requirement	Description	Satisfied by
[RS_Diag_04002]	The Diagnostic event (fault) management shall be established as Basic SW Module	[SWS_Dcm_NA_00999]
[RS_Diag_04003]	Network independent design	[SWS_Dcm_00030]
[RS_Diag_04005]	Manage Security Access level handling	[SWS_Dcm_00020] [SWS_Dcm_00033] [SWS_Dcm_00252] [SWS_Dcm_00338] [SWS_Dcm_01397] [SWS_Dcm_01535] [SWS_Dcm_CONSTR_6083]
[RS_Diag_04006]	Manage session handling	[SWS_Dcm_00022] [SWS_Dcm_00250] [SWS_Dcm_00339] [SWS_Dcm_01373] [SWS_Dcm_01374] [SWS_Dcm_01375] [SWS_Dcm_01376] [SWS_Dcm_01377] [SWS_Dcm_01378] [SWS_Dcm_01535]

Requirement	Description	Satisfied by
[RS_Diag_04007]	Provide a diagnostic service handling for the applications involved in diagnostic functionality	[SWS_Dcm_NA_00999]
[RS_Diag_04011]	Provide diagnostic state information to applications	[SWS_Dcm_00338] [SWS_Dcm_00339] [SWS_Dcm_00340] [SWS_Dcm_01321] [SWS_Dcm_01322]
[RS_Diag_04015]	Timing handling according to ISO14229-2	[SWS_Dcm_00027] [SWS_Dcm_00030] [SWS_Dcm_00143] [SWS_Dcm_00144]
[RS_Diag_04016]	Support "Busy handling" by sending a negative response 0x78	[SWS_Dcm_00024]
[RS_Diag_04019]	Provide confirmation after transmit diagnostic responses to the application	[SWS_Dcm_NA_00999]
[RS_Diag_04020]	Suppress responses to diagnostic tool requests	[SWS_Dcm_00001] [SWS_Dcm_00200]
[RS_Diag_04021]	Handling of different diagnostic sessions in parallel	[SWS_Dcm_00015]
[RS_Diag_04024]	Access and handle specific data elements and data element groups if requested by an external scan tool	[SWS_Dcm_NA_00999]
[RS_Diag_04031]	Notify the Function Inhibition Manager (FIM) upon changes of the event status in order to process them according to the SW components dependencies	[SWS_Dcm_NA_00999]
[RS_Diag_04032]	Different diagnostic addresses shall be supported by multiple (physical) channels	[SWS_Dcm_NA_00999]
[RS_Diag_04033]	Support the upload/download services for reading/writing data in an ECU in an extended and manufacturer specific diagnostic session	[SWS_Dcm_00496] [SWS_Dcm_00499] [SWS_Dcm_00502] [SWS_Dcm_00503] [SWS_Dcm_00504] [SWS_Dcm_00505] [SWS_Dcm_01417] [SWS_Dcm_01418] [SWS_Dcm_01419] [SWS_Dcm_01420] [SWS_Dcm_01421] [SWS_Dcm_01422]
[RS_Diag_04057]	Classification of events for series production, OBD and expert usage	[SWS_Dcm_NA_00999]
[RS_Diag_04058]	Ability to access different event memories	[SWS_Dcm_00004] [SWS_Dcm_00005] [SWS_Dcm_00077] [SWS_Dcm_00279] [SWS_Dcm_00293] [SWS_Dcm_00295] [SWS_Dcm_00378] [SWS_Dcm_00383] [SWS_Dcm_00384] [SWS_Dcm_00388] [SWS_Dcm_00389] [SWS_Dcm_00393] [SWS_Dcm_00465] [SWS_Dcm_01147] [SWS_Dcm_01263]
[RS_Diag_04059]	Configuration of timing parameters	[SWS_Dcm_NA_00999]

Requirement	Description	Satisfied by
[RS_Diag_04063]	Process a dedicated event identifier for each monitoring path to support an autonomous handling of different events/ faults	[SWS_Dcm_NA_00999]
[RS_Diag_04064]	Provide configurable buffer sizes for storage of the events, status information and environmental data	[SWS_Dcm_NA_00999]
[RS_Diag_04067]	Provide the diagnostic status information according to ISO 14229-1	[SWS_Dcm_00293] [SWS_Dcm_00378]
[RS_Diag_04068]	The diagnostic in AUTOSAR shall support event specific debounce counters to improve signal quality internally (According to ISO 14229-1 Appendix D)	[SWS_Dcm_NA_00999]
[RS_Diag_04071]	Process events according to their defined importance like priority and/or severity	[SWS_Dcm_NA_00999]
[RS_Diag_04077]	Uses standard mechanisms provided by persistency modules	[SWS_Dcm_NA_00999]
[RS_Diag_04085]	No description	[SWS_Dcm_NA_00999]
[RS_Diag_04086]	No description	[SWS_Dcm_NA_00999]
[RS_Diag_04087]	No description	[SWS_Dcm_NA_00999]
[RS_Diag_04089]	No description	[SWS_Dcm_NA_00999]
[RS_Diag_04090]	No description	[SWS_Dcm_NA_00999]
[RS_Diag_04091]	Notification about valid freeze frame data to applications	[SWS_Dcm_NA_00999]
[RS_Diag_04093]	Memory overflow indication	[SWS_Dcm_NA_00999]
[RS_Diag_04097]	Decentralized and modular diagnostic configuration in applications	[SWS_Dcm_NA_00999]
[RS_Diag_04098]	Interact with standard bootloader	[SWS_Dcm_00532] [SWS_Dcm_00535] [SWS_Dcm_00536] [SWS_Dcm_00592] [SWS_Dcm_00654] [SWS_Dcm_00767] [SWS_Dcm_01163] [SWS_Dcm_01177] [SWS_Dcm_01423] [SWS_Dcm_01424] [SWS_Dcm_01425] [SWS_Dcm_CONSTR_6080]
[RS_Diag_04100]	No description	[SWS_Dcm_NA_00999]
[RS_Diag_04101]	No description	[SWS_Dcm_NA_00999]
[RS_Diag_04105]	Event memory management	[SWS_Dcm_NA_00999]
[RS_Diag_04107]	Provide defensive behavior	[SWS_Dcm_NA_00999]
[RS_Diag_04109]	Provide an interface to retrieve the number of event memory entries	[SWS_Dcm_NA_00999]
[RS_Diag_04110]	SAE J1939 lamp status	[SWS_Dcm_NA_00999]
[RS_Diag_04111]	SAE J1939 Expanded-Freeze Frame	[SWS_Dcm_NA_00999]
[RS_Diag_04112]	The DEM module shall support DTCs according to SAE J1939	[SWS_Dcm_NA_00999]

Requirement	Description	Satisfied by
[RS_Diag_04113]	Support a set of SAE J1939 DM-messages	[SWS_Dcm_NA_00999]
[RS_Diag_04115]	The optional parameter DTCSettingControlOption Record as part of UDS service ControlDTCSetting shall be limited to GroupOfDTC	[SWS_Dcm_00406] [SWS_Dcm_01063]
[RS_Diag_04117]	Configurable behavior for DTC deletion	[SWS_Dcm_NA_00999]
[RS_Diag_04118]	Optionally support event displacement	[SWS_Dcm_NA_00999]
[RS_Diag_04119]	Handle the execution of diagnostic services according to the assigned diagnostic session	[SWS_Dcm_00628] [SWS_Dcm_00858] [SWS_Dcm_00859] [SWS_Dcm_01435] [SWS_Dcm_NA_00999]
[RS_Diag_04120]	Support a predefined Address AndLengthFormatIdentifier	[SWS_Dcm_NA_00999]
[RS_Diag_04121]	Provide the handling of service DynamicallyDefineDataIdentifier according to ISO 14229-1	[SWS_Dcm_NA_00999]
[RS_Diag_04123]	Harmonized Driving//WarmUp cycles	[SWS_Dcm_NA_00999]
[RS_Diag_04124]	Store the current debounce counter value non-volatile to over a power-down cycle	[SWS_Dcm_NA_00999]
[RS_Diag_04125]	Event debounce counter shall be configurable	[SWS_Dcm_NA_00999]
[RS_Diag_04126]	Configurable suppression of events	[SWS_Dcm_NA_00999]
[RS_Diag_04127]	Configurable record numbers and trigger options for DTCSnapshotRecords and DTCExtendedDataRecords	[SWS_Dcm_NA_00999]
[RS_Diag_04129]	Provide OBD-specific configuration capabilities	[SWS_Dcm_NA_00999]
[RS_Diag_04131]	Consistent event management mechanisms	[SWS_Dcm_NA_00999]
[RS_Diag_04133]	Aging for event memory entries	[SWS_Dcm_NA_00999]
[RS_Diag_04135]	Support UDS service \$38 (RequestFileTransfer)	[SWS_Dcm_NA_00999]
[RS_Diag_04136]	Configurable "confirmed" threshold	[SWS_Dcm_NA_00999]
[RS_Diag_04137]	Definition of replacement failure	[SWS_Dcm_NA_00999]
[RS_Diag_04139]	Support subfunction 0x42 of UDS service 0x19	[SWS_Dcm_NA_00999]
[RS_Diag_04140]	Aging for UDS status bits "confirmedDTC" and "testFailed SinceLastClear"	[SWS_Dcm_NA_00999]
[RS_Diag_04143]	No description	[SWS_Dcm_NA_00999]
[RS_Diag_04144]	No description	[SWS_Dcm_NA_00999]
[RS_Diag_04145]	No description	[SWS_Dcm_NA_00999]
[RS_Diag_04146]	No description	[SWS_Dcm_NA_00999]
[RS_Diag_04147]	Communication with the transport layers to receive and send diagnostic data	[SWS_Dcm_00642] [SWS_Dcm_01186]

Requirement	Description	Satisfied by
[RS_Diag_04148]	Provide capabilities to inform applications about diagnostic data changes	[SWS_Dcm_NA_00999]
[RS_Diag_04150]	Support the primary fault memory defined by ISO 14229-1	[SWS_Dcm_NA_00999]
[RS_Diag_04151]	Event status handling	[SWS_Dcm_NA_00999]
[RS_Diag_04153]	Support generic connections	[SWS_Dcm_00849] [SWS_Dcm_01347] [SWS_Dcm_01348]
[RS_Diag_04159]	Control of DTC storage	[SWS_Dcm_00249] [SWS_Dcm_01399]
[RS_Diag_04162]	Parallel fault memory access	[SWS_Dcm_01369] [SWS_Dcm_01370] [SWS_Dcm_01371] [SWS_Dcm_01372]
[RS_Diag_04163]	Parallel OBD and UDS processing	[SWS_Dcm_01365] [SWS_Dcm_01366] [SWS_Dcm_01367]
[RS_Diag_04215]	Support of UDS service Read DataByPeriodicIdentifier (0x2A)	[SWS_Dcm_00716] [SWS_Dcm_00721] [SWS_Dcm_00722] [SWS_Dcm_00820] [SWS_Dcm_00843] [SWS_Dcm_00851] [SWS_Dcm_01093] [SWS_Dcm_01094] [SWS_Dcm_01095] [SWS_Dcm_01096] [SWS_Dcm_01097] [SWS_Dcm_01098] [SWS_Dcm_01099] [SWS_Dcm_01100] [SWS_Dcm_01101] [SWS_Dcm_01103] [SWS_Dcm_01104] [SWS_Dcm_01105] [SWS_Dcm_01106] [SWS_Dcm_01107] [SWS_Dcm_01108] [SWS_Dcm_01109] [SWS_Dcm_01110] [SWS_Dcm_01111] [SWS_Dcm_01112] [SWS_Dcm_01115] [SWS_Dcm_01117] [SWS_Dcm_01118] [SWS_Dcm_01426] [SWS_Dcm_01427] [SWS_Dcm_01428] [SWS_Dcm_01568] [SWS_Dcm_01569] [SWS_Dcm_01570] [SWS_Dcm_01571] [SWS_Dcm_01572] [SWS_Dcm_01573] [SWS_Dcm_01574] [SWS_Dcm_01575] [SWS_Dcm_01576] [SWS_Dcm_01577] [SWS_Dcm_01578]
[RS_Diag_04218]	Support of UDS service 0x2F InputOutputControlByIdentifier	[SWS_Dcm_00256] [SWS_Dcm_00396] [SWS_Dcm_00397] [SWS_Dcm_00398] [SWS_Dcm_00399] [SWS_Dcm_00563] [SWS_Dcm_00564] [SWS_Dcm_00565] [SWS_Dcm_00579] [SWS_Dcm_00580] [SWS_Dcm_00581] [SWS_Dcm_00640] [SWS_Dcm_00680] [SWS_Dcm_00682] [SWS_Dcm_01273] [SWS_Dcm_01274] [SWS_Dcm_01275] [SWS_Dcm_01277] [SWS_Dcm_01313] [SWS_Dcm_01434] [SWS_Dcm_01436] [SWS_Dcm_01437] [SWS_Dcm_01438] [SWS_Dcm_01439] [SWS_Dcm_01440] [SWS_Dcm_01441] [SWS_Dcm_01554] [SWS_Dcm_91057] [SWS_Dcm_91058] [SWS_Dcm_91059] [SWS_Dcm_91060] [SWS_Dcm_91061] [SWS_Dcm_CONSTR_6084] [SWS_Dcm_CONSTR_6085] [SWS_Dcm_CONSTR_6086]

Requirement	Description	Satisfied by
[RS_Diag_04224]	Support the UDS service 0x31 (RoutineControl) according to ISO 14229-1	[SWS_Dcm_01442] [SWS_Dcm_01443] [SWS_Dcm_01580] [SWS_Dcm_01581]
[RS_Diag_04230]	Support of UDS service 0x29 (Authentication)	[SWS_Dcm_01459] [SWS_Dcm_01460] [SWS_Dcm_01461] [SWS_Dcm_01463] [SWS_Dcm_01464] [SWS_Dcm_01465] [SWS_Dcm_01466] [SWS_Dcm_01467] [SWS_Dcm_01468] [SWS_Dcm_01469] [SWS_Dcm_01477] [SWS_Dcm_01478] [SWS_Dcm_01479] [SWS_Dcm_01480] [SWS_Dcm_01481] [SWS_Dcm_01482] [SWS_Dcm_01483] [SWS_Dcm_01484] [SWS_Dcm_01485] [SWS_Dcm_01486] [SWS_Dcm_01487] [SWS_Dcm_01488] [SWS_Dcm_01489] [SWS_Dcm_01493] [SWS_Dcm_01503] [SWS_Dcm_01504] [SWS_Dcm_01506] [SWS_Dcm_01507] [SWS_Dcm_01508] [SWS_Dcm_01509] [SWS_Dcm_01510] [SWS_Dcm_01511] [SWS_Dcm_01512] [SWS_Dcm_01513] [SWS_Dcm_01515] [SWS_Dcm_01518] [SWS_Dcm_01528] [SWS_Dcm_01529] [SWS_Dcm_01530] [SWS_Dcm_01532] [SWS_Dcm_01533] [SWS_Dcm_01534] [SWS_Dcm_01535] [SWS_Dcm_01536] [SWS_Dcm_01537] [SWS_Dcm_01538] [SWS_Dcm_01542] [SWS_Dcm_01544] [SWS_Dcm_01551] [SWS_Dcm_01558] [SWS_Dcm_01559] [SWS_Dcm_01560] [SWS_Dcm_01561] [SWS_Dcm_01565] [SWS_Dcm_01579] [SWS_Dcm_01588] [SWS_Dcm_CONSTR_6094] [SWS_Dcm_CONSTR_6096]
[RS_Diag_04232]	Access rights in client certificates	[SWS_Dcm_01516] [SWS_Dcm_CONSTR_6087] [SWS_Dcm_CONSTR_6089]
[RS_Diag_04233]	Access granularity of diagnostic services	[SWS_Dcm_01496] [SWS_Dcm_01514] [SWS_Dcm_01539] [SWS_Dcm_01540] [SWS_Dcm_01541] [SWS_Dcm_01545] [SWS_Dcm_01546] [SWS_Dcm_01547] [SWS_Dcm_01548] [SWS_Dcm_01549] [SWS_Dcm_01552] [SWS_Dcm_01553] [SWS_Dcm_01555] [SWS_Dcm_01556] [SWS_Dcm_01557] [SWS_Dcm_01562] [SWS_Dcm_CONSTR_6088]
[RS_Diag_04233; RS_Diag_04234]	No description	[SWS_Dcm_01522] [SWS_Dcm_01523] [SWS_Dcm_01524] [SWS_Dcm_01525] [SWS_Dcm_01526] [SWS_Dcm_01527]
[RS_Diag_04234]	Binary compatibility of white list for individual access	[SWS_Dcm_01521]
[RS_Diag_04235]	Client certificate validity	[SWS_Dcm_01470] [SWS_Dcm_01471] [SWS_Dcm_01472] [SWS_Dcm_01473] [SWS_Dcm_01474] [SWS_Dcm_01475] [SWS_Dcm_01476]

Requirement	Description	Satisfied by
[RS_Diag_04236]	Client certificate target identification	[SWS_Dcm_01490] [SWS_Dcm_01491] [SWS_Dcm_01492]
[RS_Diag_04243]	Update of constant parameters through diagnostics	[SWS_Dcm_01582] [SWS_Dcm_01583] [SWS_Dcm_01584] [SWS_Dcm_01585] [SWS_Dcm_01586] [SWS_Dcm_01587] [SWS_Dcm_91088]
[RS_Diag_04248]	Support of session control service	[SWS_Dcm_00311]
[RS_Diag_04249]	Support of session layer service	[SWS_Dcm_00024] [SWS_Dcm_00027] [SWS_Dcm_00111] [SWS_Dcm_00112] [SWS_Dcm_00114] [SWS_Dcm_00115] [SWS_Dcm_00117] [SWS_Dcm_00141] [SWS_Dcm_00143] [SWS_Dcm_00557] [SWS_Dcm_00654] [SWS_Dcm_00669] [SWS_Dcm_00671] [SWS_Dcm_00673] [SWS_Dcm_00703] [SWS_Dcm_00837] [SWS_Dcm_00839] [SWS_Dcm_01073] [SWS_Dcm_01145] [SWS_Dcm_01425]
[RS_ids_00810]	Basic SW security events	[SWS_Dcm_01589] [SWS_Dcm_01590]
[SRS_BSW_00003]	All software modules shall provide version and identification information	[SWS_Dcm_00065]
[SRS_BSW_00005]	Modules of the μ C Abstraction Layer (MCAL) may not have hard coded horizontal interfaces	[SWS_Dcm_NA_00999]
[SRS_BSW_00006]	The source code of software modules above the μ C Abstraction Layer (MCAL) shall not be processor and compiler dependent.	[SWS_Dcm_NA_00999]
[SRS_BSW_00007]	All Basic SW Modules written in C language shall conform to the MISRA C 2012 Standard.	[SWS_Dcm_NA_00999]
[SRS_BSW_00009]	All Basic SW Modules shall be documented according to a common standard.	[SWS_Dcm_NA_00999]
[SRS_BSW_00010]	The memory consumption of all Basic SW Modules shall be documented for a defined configuration for all supported platforms.	[SWS_Dcm_NA_00999]
[SRS_BSW_00101]	The Basic Software Module shall be able to initialize variables and hardware in a separate initialization function	[SWS_Dcm_00033] [SWS_Dcm_00034] [SWS_Dcm_00035] [SWS_Dcm_00036] [SWS_Dcm_00037]
[SRS_BSW_00158]	No description	[SWS_Dcm_NA_00999]
[SRS_BSW_00159]	All modules of the AUTOSAR Basic Software shall support a tool based configuration	[SWS_Dcm_NA_00999]
[SRS_BSW_00160]	Configuration files of AUTOSAR Basic SW module shall be readable for human beings	[SWS_Dcm_NA_00999]

Requirement	Description	Satisfied by
[SRS_BSW_00161]	The AUTOSAR Basic Software shall provide a microcontroller abstraction layer which provides a standardized interface to higher software layers	[SWS_Dcm_NA_00999]
[SRS_BSW_00162]	The AUTOSAR Basic Software shall provide a hardware abstraction layer	[SWS_Dcm_NA_00999]
[SRS_BSW_00164]	The Implementation of interrupt service routines shall be done by the Operating System, complex drivers or modules	[SWS_Dcm_NA_00999]
[SRS_BSW_00167]	All AUTOSAR Basic Software Modules shall provide configuration rules and constraints to enable plausibility checks	[SWS_Dcm_NA_00999]
[SRS_BSW_00168]	SW components shall be tested by a function defined in a common API in the Basis-SW	[SWS_Dcm_NA_00999]
[SRS_BSW_00170]	The AUTOSAR SW Components shall provide information about their dependency from faults, signal qualities, driver demands	[SWS_Dcm_NA_00999]
[SRS_BSW_00171]	Optional functionality of a Basic-SW component that is not required in the ECU shall be configurable at pre-compile-time	[SWS_Dcm_NA_00999]
[SRS_BSW_00172]	The scheduling strategy that is built inside the Basic Software Modules shall be compatible with the strategy used in the system	[SWS_Dcm_NA_00999]
[SRS_BSW_00300]	All AUTOSAR Basic Software Modules shall be identified by an unambiguous name	[SWS_Dcm_NA_00999]
[SRS_BSW_00301]	All AUTOSAR Basic Software Modules shall only import the necessary information	[SWS_Dcm_NA_00999]
[SRS_BSW_00304]	All AUTOSAR Basic Software Modules shall use the following data types instead of native C data types	[SWS_Dcm_NA_00999]
[SRS_BSW_00305]	Data types naming convention	[SWS_Dcm_NA_00999]
[SRS_BSW_00306]	AUTOSAR Basic Software Modules shall be compiler and platform independent	[SWS_Dcm_NA_00999]
[SRS_BSW_00307]	Global variables naming convention	[SWS_Dcm_NA_00999]
[SRS_BSW_00308]	AUTOSAR Basic Software Modules shall not define global data in their header files, but in the C file	[SWS_Dcm_NA_00999]

Requirement	Description	Satisfied by
[SRS_BSW_00309]	All AUTOSAR Basic Software Modules shall indicate all global data with read-only purposes by explicitly assigning the const keyword	[SWS_Dcm_NA_00999]
[SRS_BSW_00310]	API naming convention	[SWS_Dcm_NA_00999]
[SRS_BSW_00312]	Shared code shall be reentrant	[SWS_Dcm_NA_00999]
[SRS_BSW_00314]	All internal driver modules shall separate the interrupt frame definition from the service routine	[SWS_Dcm_NA_00999]
[SRS_BSW_00318]	Each AUTOSAR Basic Software Module file shall provide version numbers in the header file	[SWS_Dcm_NA_00999]
[SRS_BSW_00321]	The version numbers of AUTOSAR Basic Software Modules shall be enumerated according specific rules	[SWS_Dcm_NA_00999]
[SRS_BSW_00323]	All AUTOSAR Basic Software Modules shall check passed API parameters for validity	[SWS_Dcm_NA_00999]
[SRS_BSW_00325]	The runtime of interrupt service routines and functions that are running in interrupt context shall be kept short	[SWS_Dcm_NA_00999]
[SRS_BSW_00327]	Error values naming convention	[SWS_Dcm_NA_00999]
[SRS_BSW_00328]	All AUTOSAR Basic Software Modules shall avoid the duplication of code	[SWS_Dcm_NA_00999]
[SRS_BSW_00330]	It shall be allowed to use macros instead of functions where source code is used and runtime is critical	[SWS_Dcm_NA_00999]
[SRS_BSW_00331]	All Basic Software Modules shall strictly separate error and status information	[SWS_Dcm_NA_00999]
[SRS_BSW_00333]	For each callback function it shall be specified if it is called from interrupt context or not	[SWS_Dcm_NA_00999]
[SRS_BSW_00334]	All Basic Software Modules shall provide an XML file that contains the meta data	[SWS_Dcm_NA_00999]
[SRS_BSW_00335]	Status values naming convention	[SWS_Dcm_NA_00999]
[SRS_BSW_00336]	Basic SW module shall be able to shutdown	[SWS_Dcm_NA_00999]
[SRS_BSW_00337]	Classification of development errors	[SWS_Dcm_00040]
[SRS_BSW_00339]	Reporting of production relevant error status	[SWS_Dcm_NA_00999]
[SRS_BSW_00341]	Module documentation shall contains all needed informations	[SWS_Dcm_NA_00999]

Requirement	Description	Satisfied by
[SRS_BSW_00342]	It shall be possible to create an AUTOSAR ECU out of modules provided as source code and modules provided as object code, even mixed	[SWS_Dcm_NA_00999]
[SRS_BSW_00343]	The unit of time for specification and configuration of Basic SW modules shall be preferably in physical time unit	[SWS_Dcm_NA_00999]
[SRS_BSW_00344]	BSW Modules shall support link-time configuration	[SWS_Dcm_NA_00999]
[SRS_BSW_00345]	BSW Modules shall support pre-compile configuration	[SWS_Dcm_NA_00999]
[SRS_BSW_00346]	All AUTOSAR Basic Software Modules shall provide at least a basic set of module files	[SWS_Dcm_NA_00999]
[SRS_BSW_00347]	A Naming separation of different instances of BSW drivers shall be in place	[SWS_Dcm_NA_00999]
[SRS_BSW_00350]	All AUTOSAR Basic Software Modules shall allow the enabling/disabling of detection and reporting of development errors.	[SWS_Dcm_NA_00999]
[SRS_BSW_00351]	Encapsulation of compiler specific methods to map objects	[SWS_Dcm_NA_00999]
[SRS_BSW_00353]	All integer type definitions of target and compiler specific scope shall be placed and organized in a single type header	[SWS_Dcm_NA_00999]
[SRS_BSW_00357]	For success/failure of an API call a standard return type shall be defined	[SWS_Dcm_NA_00999]
[SRS_BSW_00358]	The return type of init() functions implemented by AUTOSAR Basic Software Modules shall be void	[SWS_Dcm_NA_00999]
[SRS_BSW_00359]	All AUTOSAR Basic Software Modules callback functions shall avoid return types other than void if possible	[SWS_Dcm_NA_00999]
[SRS_BSW_00360]	AUTOSAR Basic Software Modules callback functions are allowed to have parameters	[SWS_Dcm_NA_00999]
[SRS_BSW_00361]	All mappings of not standardized keywords of compiler specific scope shall be placed and organized in a compiler specific type and keyword header	[SWS_Dcm_NA_00999]
[SRS_BSW_00369]	All AUTOSAR Basic Software Modules shall not return specific development error codes via the API	[SWS_Dcm_00044]

Requirement	Description	Satisfied by
[SRS_BSW_00371]	The passing of function pointers as API parameter is forbidden for all AUTOSAR Basic Software Modules	[SWS_Dcm_NA_00999]
[SRS_BSW_00373]	The main processing function of each AUTOSAR Basic Software Module shall be named according the defined convention	[SWS_Dcm_00053]
[SRS_BSW_00374]	All Basic Software Modules shall provide a readable module vendor identification	[SWS_Dcm_NA_00999]
[SRS_BSW_00375]	Basic Software Modules shall report wake-up reasons	[SWS_Dcm_NA_00999]
[SRS_BSW_00377]	A Basic Software Module can return a module specific types	[SWS_Dcm_NA_00999]
[SRS_BSW_00378]	AUTOSAR shall provide a boolean type	[SWS_Dcm_NA_00999]
[SRS_BSW_00379]	All software modules shall provide a module identifier in the header file and in the module XML description file.	[SWS_Dcm_NA_00999]
[SRS_BSW_00380]	Configuration parameters being stored in memory shall be placed into separate c-files	[SWS_Dcm_NA_00999]
[SRS_BSW_00383]	The Basic Software Module specifications shall specify which other configuration files from other modules they use at least in the description	[SWS_Dcm_NA_00999]
[SRS_BSW_00384]	The Basic Software Module specifications shall specify at least in the description which other modules they require	[SWS_Dcm_NA_00999]
[SRS_BSW_00385]	List possible error notifications	[SWS_Dcm_NA_00999]
[SRS_BSW_00386]	The BSW shall specify the configuration for detecting an error	[SWS_Dcm_NA_00999]
[SRS_BSW_00388]	Containers shall be used to group configuration parameters that are defined for the same object	[SWS_Dcm_NA_00999]
[SRS_BSW_00389]	Containers shall have names	[SWS_Dcm_NA_00999]
[SRS_BSW_00390]	Parameter content shall be unique within the module	[SWS_Dcm_NA_00999]
[SRS_BSW_00392]	Parameters shall have a type	[SWS_Dcm_NA_00999]
[SRS_BSW_00393]	Parameters shall have a range	[SWS_Dcm_NA_00999]
[SRS_BSW_00394]	The Basic Software Module specifications shall specify the scope of the configuration parameters	[SWS_Dcm_NA_00999]

Requirement	Description	Satisfied by
[SRS_BSW_00395]	The Basic Software Module specifications shall list all configuration parameter dependencies	[SWS_Dcm_NA_00999]
[SRS_BSW_00396]	The Basic Software Module specifications shall specify the supported configuration classes for changing values and multiplicities for each parameter/container	[SWS_Dcm_NA_00999]
[SRS_BSW_00397]	The configuration parameters in pre-compile time are fixed before compilation starts	[SWS_Dcm_NA_00999]
[SRS_BSW_00398]	The link-time configuration is achieved on object code basis in the stage after compiling and before linking	[SWS_Dcm_NA_00999]
[SRS_BSW_00399]	Parameter-sets shall be located in a separate segment and shall be loaded after the code	[SWS_Dcm_NA_00999]
[SRS_BSW_00400]	Parameter shall be selected from multiple sets of parameters after code has been loaded and started	[SWS_Dcm_NA_00999]
[SRS_BSW_00401]	Documentation of multiple instances of configuration parameters shall be available	[SWS_Dcm_NA_00999]
[SRS_BSW_00402]	Each module shall provide version information	[SWS_Dcm_NA_00999]
[SRS_BSW_00403]	The Basic Software Module specifications shall specify for each parameter/container whether it supports different values or multiplicity in different configuration sets	[SWS_Dcm_NA_00999]
[SRS_BSW_00404]	BSW Modules shall support post-build configuration	[SWS_Dcm_NA_00999]
[SRS_BSW_00405]	BSW Modules shall support multiple configuration sets	[SWS_Dcm_NA_00999]
[SRS_BSW_00406]	A static status variable denoting if a BSW module is initialized shall be initialized with value 0 before any APIs of the BSW module is called	[SWS_Dcm_NA_00999]
[SRS_BSW_00407]	Each BSW module shall provide a function to read out the version information of a dedicated module implementation	[SWS_Dcm_00065]
[SRS_BSW_00408]	All AUTOSAR Basic Software Modules configuration parameters shall be named according to a specific naming rule	[SWS_Dcm_NA_00999]

Requirement	Description	Satisfied by
[SRS_BSW_00409]	All production code error ID symbols are defined by the Dem module and shall be retrieved by the other BSW modules from Dem configuration	[SWS_Dcm_NA_00999]
[SRS_BSW_00410]	Compiler switches shall have defined values	[SWS_Dcm_NA_00999]
[SRS_BSW_00411]	All AUTOSAR Basic Software Modules shall apply a naming rule for enabling/disabling the existence of the API	[SWS_Dcm_NA_00999]
[SRS_BSW_00413]	An index-based accessing of the instances of BSW modules shall be done	[SWS_Dcm_NA_00999]
[SRS_BSW_00414]	Init functions shall have a pointer to a configuration structure as single parameter	[SWS_Dcm_NA_00999]
[SRS_BSW_00415]	Interfaces which are provided exclusively for one module shall be separated into a dedicated header file	[SWS_Dcm_NA_00999]
[SRS_BSW_00416]	The sequence of modules to be initialized shall be configurable	[SWS_Dcm_NA_00999]
[SRS_BSW_00417]	Software which is not part of the SW-C shall report error events only after the DEM is fully operational.	[SWS_Dcm_NA_00999]
[SRS_BSW_00419]	If a pre-compile time configuration parameter is implemented as "const" it should be placed into a separate c-file	[SWS_Dcm_NA_00999]
[SRS_BSW_00422]	Pre-de-bouncing of error status information is done within the DEM	[SWS_Dcm_NA_00999]
[SRS_BSW_00423]	BSW modules with AUTOSAR interfaces shall be describable with the means of the SW-C Template	[SWS_Dcm_NA_00999]
[SRS_BSW_00424]	BSW module main processing functions shall not be allowed to enter a wait state	[SWS_Dcm_00053]
[SRS_BSW_00425]	The BSW module description template shall provide means to model the defined trigger conditions of schedulable objects	[SWS_Dcm_NA_00999]
[SRS_BSW_00426]	BSW Modules shall ensure data consistency of data which is shared between BSW modules	[SWS_Dcm_NA_00999]
[SRS_BSW_00427]	ISR functions shall be defined and documented in the BSW module description template	[SWS_Dcm_NA_00999]

Requirement	Description	Satisfied by
[SRS_BSW_00428]	A BSW module shall state if its main processing function(s) has to be executed in a specific order or sequence	[SWS_Dcm_NA_00999]
[SRS_BSW_00429]	Access to OS is restricted	[SWS_Dcm_NA_00999]
[SRS_BSW_00432]	Modules should have separate main processing functions for read/receive and write/transmit data path	[SWS_Dcm_NA_00999]

7 Functional specification

7.1 Security Events

[SWS_Dcm_01589] [If security event reporting has been enabled for the [Dcm](#) module ([DcmEnableSecurityEventReporting](#) = true) the respective security events shall be reported to the [IdsM](#) via the interfaces defined in [AUTOSAR_SWS_BSWGeneral](#).] ([\(RS_Ids_00810\)](#))

[SWS_Dcm_01590] Security events for DCM [The following table lists the security events which are standardized for the [Dcm](#) together with their trigger conditions.

Context data is not provided by the [Dcm](#) for the security events.] ([\(RS_Ids_00810\)](#))

Name	Description	ID
DIAG_SEV_WRITE_INVALID_DATA	Tester writes invalid data with service WriteDataByIdentifier .	23
DIAG_SEV_SECURITY_ACCESS_DENIED	Tester has send an diagnostic request without meeting the servers security level requirements for that service. NRC 0x33 (securityAccessDenied) was returned.	24
DIAG_SEV_COMMUNICATION_CONTROL_SWITCHED_OFF	ECU communication was switched off with service CommunicationControl .	25
DIAG_SEV_SERVICE_NOT_SUPPORTED	A diagnostic service was requested that is not supported or not supported in the active session. NRC 0x11 (serviceNotSupported) or NRC 0x7F (serviceNotSupportedInActiveSession) was returned.	26
DIAG_SEV_SUBFUNCTION_NOT_SUPPORTED	A subfunction of a diagnostic service was requested that is not supported for the requested service.	27
DIAG_SEV_INCORRECT_MESSAGE_LENGTH_OR_FORMAT	Received request message does not match the specified length or the format of the parameters is different from the specified ones for that service. NRC 0x13 (incorrectMessageLengthOrInvalidFormat) was returned.	28
DIAG_SEV_REQUEST_SEQUENCE_ERROR	A diagnostic service was received in the wrong sequence order. NRC 0x24 (requestSequenceError) was returned.	29
DIAG_SEV_REQUEST_OUT_OF_RANGE	A diagnostic request with a parameter that is out of the allowed bounds was received. A NRC 0x31 (requestOutOfRange) was returned.	30
DIAG_SEV_REQUESTED_ACTIONSQUIRES_AUTHENTICATION	A diagnostic request was received while the required authentication to execute this service is not given. NRC 0x34 (authenticationRequired) was returned.	31
DIAG_SEV_SECURITY_ACCESS_NUMBER_OF_ATTEMPTS_EXCEEDED	Security Access failed and the number of invalid attempts has been exceeded. NRC 0x36 (exceedNumberOfAttempts) was returned.	32
DIAG_SEV_SECURITY_ACCESS_INVALID_KEY	Security Access failed because the tester has send an invalid key to the server. An NRC 0x35 (invalidKey) was returned.	33

△

Name	Description	ID
DIAG_SEV_SECURITY_ACCESS_REQUIRED_TIME_DELAY_NOT_EXPIRED	A further attempt to unlock the ECU was taken before the delay time had expired. NRC 0x37 (requiredTimeDelayNotExpired) was sent.	34
DIAG_SEV_NUMBER_OF_FAILED_AUTHENTICATION_ATTEMPTS_EXCEEDED	Number of failed authentication attempts - OEM specific	35
DIAG_SEV_CERTIFICATE_FAILURE	The tester tried an authentication with an invalid certificate.	36
DIAG_SEV_ECU_UNLOCK_SUCCESSFUL	Successful unlocked the ECU (via Security Access \$27), per Level	37
DIAG_SEV_AUTHENTICATION_SUCCESSFUL	Succesfully authenticated (via Authentication \$29)	38
DIAG_SEV_CLEAR_DTC_SUCCESSFUL	DTC information has been cleared by SID 0x14 Clear DTCInformation	39
DIAG_SEV_ECU_RESET	ECU had been reset by SID 0x11 ResetECU	40
DIAG_SEV_WRITE_DATA	Diagnostic data identifier have been written by SID 0x2E.	41
DIAG_SEV_REQUEST_DOWNLOAD	A diagnostic data download sequence was requested with SID 0x34.	42
DIAG_SEV_DTC_SETTING_SWITCHED_OFF	DTC setting switched off with service 0x85 (Control DTCSetting).	43

7.2 Error Classification

This section describes how the [Dcm](#) module has to treat the several error classes that may happen during the life cycle of the [Dcm](#) module.

Diagnostic-Communication-Errors are handled directly in the ISO-Protocols by NRCs.

[SWS_Dcm_00044] [The error values shall be the unique for all error types. The [Dcm](#) shall use only the values given in this chapter.] ([SRS_BSW_00369](#))

Section "Error Handling" of the document "General Specification of Basic Software Modules" describes the error handling of the Basic Software in detail. Above all, it constitutes a classification scheme consisting of five error types which may occur in BSW modules.

Based on this foundation, the following section specifies particular errors arranged in the respective subsections below.

7.2.1 Development Errors

The errors and exceptions described in [\[SWS_Dcm_00040\]](#) shall be detectable by the [Dcm](#) module depending on its build version (development/production mode).

[SWS_Dcm_00040] [

Type of error	Related error code	Error value
Interface return-value is out of range	DCM_E_INTERFACE_RETURN_VALUE	0x02
The Dcm is getting called with an invalid input parameter value or the Dcm has called an function and this function returns an invalid out parameter or return value.	DCM_E_INVALID_VALUE	0x02
Internal:Dcm not initialized	DCM_E_UNINIT	0x05
Dcm API function with invalid input parameter	DCM_E_PARAM	0x06
Dcm API service invoked with NULL POINTER as parameter	DCM_E_PARAM_POINTER	0x07
Dcm initialisation failed	DCM_E_INIT_FAILED	0x08
Storing the ProgConditions failed	DCM_E_SET_PROG_CONDITIONS_FAIL	0x09

]([SRS_BSW_00337](#))

7.2.2 Runtime Errors

The errors and exceptions described in [[SWS_Dcm_01416](#)] shall be detectable by the Dcm module depending on its build version (development/production mode).

[[SWS_Dcm_01416](#)] ↴

Type of error	Related error code	Error value
Interface: Timeout occurred during interaction with another module (e.g. maximum number of response pending is reached, refer to [SWS_Dcm_00120])	DCM_E_INTERFACE_TIMEOUT	0x01
Interface: Boundary check of buffers provided by the Dcm failed during interaction with another module (application, Dem, PduR, etc.)	DCM_E_INTERFACE_BUFFER_OVERFLOW	0x03

]([SRS_BSW_00452](#))

7.2.3 Transient Faults

There are no transient faults.

7.2.4 Production Errors

There are no production errors.

7.2.5 Extended Production Errors

There are no extended production errors.

7.3 General design elements

7.3.1 Submodules within the `Dcm` module

To define the functionality of the `Dcm` module, The `Dcm` SWS models the `Dcm` module as consisting of the following submodules:

- Diagnostic Session Layer (DSL) submodule: The `DSL` submodule ensures data flow concerning diagnostic requests and responses, supervises and guarantees diagnostic protocol timing and manages diagnostic states (especially diagnostic session and security).
- Diagnostic Service Dispatcher (DSD) submodule: The `DSD` submodule processes a stream of diagnostic data. The submodule:
 - Receives a new diagnostic request over a network and forwards it to a data processor.
 - Transmits a diagnostic response over a network when triggered by the data processor (e.g. by the `DSP` submodule).
- Diagnostic Service Processing (DSP) submodule: The `DSP` submodule handles the actual diagnostic service (respectively subservice) requests.

The next graphic gives an overview of the interfaces between the submodules `DSP`, `DSD`, and `DSL` within the `Dcm` module.

Figure 7.1: Possible interaction between the submodules in the DCM

Note: The implementation of these submodules and the interfaces between them is not mandatory. They are introduced only to improve the readability of the specification.

7.3.2 Negative Response Code (NRC)

The standards defining the [UDS](#) Services and [OBD](#) Services define the negative response codes (NRCs). The [Dcm](#) SWS uses these NRCs in the interfaces between the [Dcm](#) and other BSW modules and the SW-Cs. These NRCs are defined in the data type [Dcm_NegativeResponseCodeType](#).

[SWS_Dcm_01075] [The order of the transmitted [NRC](#) shall be compliant with the one described in ISO14229-1 [1].]()

7.3.3 Non-volatile information

Several features of the [Dcm](#) require non-volatile information to be initialized. AUTOSAR does not describe how this information is accessed or if the information is already available when the [Dcm](#) is initialized. Therefore the access for the non-volatile information is implementation specific and has to be ensured during integration.

[SWS_Dcm_00870] [The [Dcm](#) shall check if the NvM is read out correctly. If the non-volatile information could not read out correct the [Dcm](#) shall start a default reaction. The default reaction is described in the chapter were the usage of the non-volatile data is described.]()

[SWS_Dcm_01048] [If the [Dcm](#) cancels a service with NvM access, it shall call [NvM_CancelJobs\(\)](#).]()

The service is cancelled either by reaching the maximum number of RCRRP NRCs or by protocol preemption.

7.3.4 Types

[SWS_Dcm_00969] [The [Dcm](#) shall treat non-integer data types (e.g. `uint8[n]`) either like integer data types of the matching size or leave their contents uninterpreted in case [DcmDspDataEndianness](#) is configured to OPAQUE.]()

[SWS_Dcm_00970] [The [Dcm](#) module shall interpret opaque data as `uint8[n]` and shall always map it to an n-bytes sized signal. For opaque data endianness, [DcmDspDataEndianness](#) has to be configured to OPAQUE.]()

[SWS_Dcm_00971] [The [Dcm](#) shall extend the endianness conversion defined in [9], to signed data types.]()

In [9] (Chapter 2.4) the endianness conversion is defined for unsigned data types. The associated configurations can be found in the configuration ?? [DcmDspData](#).

7.3.4.1 Atomic types overview

ATOMIC							
Data bit size	1 (Byte aligned)	8	16	32	8	16	32
DcmDspDIdDataType	BOOLEAN	UINT8	UINT16	UINT32	SINT8	SINT16	SINT32
DcmDspDataEndianness	N/A	N/A	LE,BE	LE,BE	N/A	LE,BE	LE,BE
DcmDspDataUse Port				S/R, C/S and I/O			
resulting ImplType	boolean	UINT8	UINT16	UINT32	SINT8	SINT16	SINT32

Figure 7.2: Atomic types overview

7.3.4.2 Data array types overview

Data bit size	Field (Static)				Field (Dynamic)	
	8-8*N	16-16*N	32-32*N	8-8*N	Field (Dynamic)	Field (Dynamic)
DcmDspDataByteSize	Any	(size MOD 2)==0	(size MOD 4)==0	Any		
DcmDspDIdDataType	UINT8_N	SINT8_N	UINT16_N	SINT16_N	UINT32_N	SINT32_N
DcmDspDataEndianness	N/A			LE,BE		UINT8_DYN
DcmDspDataUse Port	S/R, C/S, FNC, NVM		S/R, C/S			N/A
resulting ImplType	DataArrayTypeUInt8_(Data)	DataArrayTypeSint8_(Data)	DataArrayTypeUInt16_(Data)	DataArrayTypeSint16_(Data)	DataArrayTypeUInt32_(Data)	DataArrayTypeSint32_(Data)

Figure 7.3: Data array types overview

7.3.4.3 Data types constraints

[SWS_Dcm_CONSTR_6002] Existence of size parameter [DcmDspDataByteSize shall be present if DcmDspDataType is set to: UINT8_N, SINT8_N, UINT16_N, SINT16_N, UINT32_N, SINT32_N or UINT8_DYN.]()

Note: DcmDspDataByteSize is not required for primitive datatypes

[SWS_Dcm_CONSTR_6035] Restrictions on size parameter for 16 Bit arrays [DcmDspDataByteSize shall be a multiple of 2 if the value is greater than 2 and DcmDspDataType is UINT16_N or SINT16_N.]()

[SWS_Dcm_CONSTR_6036] Restrictions on size parameter for 32 Bit arrays [DcmDspDataByteSize shall be a multiple of 4 if the value is greater than 4 and DcmDspDataType is UINT32_N or SINT32_N.]()

[SWS_Dcm_CONSTR_6008] Define the usage of DcmDspRoutineParameter-Size parameter [DcmDspRoutineParameterSize is only required if DcmDspRoutineSignalType is set to SINT8_N, SINT16_N, SINT32_N, UINT8_N, UINT16_N, UINT32_N or VARIABLE_LENGTH.]()

[SWS_Dcm_CONSTR_6011] Only last parameters in RID may have a variable length [DcmDspRoutineSignalType with VARIABLE_LENGTH is only valid for the last signal.]()

[SWS_Dcm_CONSTR_6012] Existence of size parameter [DcmDspPidDataByteSize shall be present if DcmDspPidDataType is set to: UINT8_N, SINT8_N, UINT16_N, SINT16_N, UINT32_N or SINT32_N.]()

Note: `DcmDspPidDataByteSize` is not required for primitive datatypes

[SWS_Dcm_CONSTR_6040] Restrictions on size parameter for 16 Bit arrays [`DcmDspPidDataByteSize` shall be a multiple of 2 if the value is greater than 2 and `DcmDspPIDDataType` is `UINT16_N` or `SINT16_N`.]()

[SWS_Dcm_CONSTR_6041] Restrictions on size parameter for 32 Bit arrays [`DcmDspPidDataByteSize` shall be a multiple of 4 if the value is greater than 4 and `DcmDspPIDDataType` is `UINT32_N` or `SINT32_N`.]()

`UINT8` shall be used as (implementation) data type for bit lengths between 1 and 8

[SWS_Dcm_CONSTR_6038] Restrictions on datatype usage [`DcmDspDataType` shall be `UINT8_N`, in case `DcmDspDataUsePort` is equal to `USE_BLOCK_ID`.]()

[SWS_Dcm_CONSTR_6026] Usage of variable data length in case of S/R communication, NvRam access or ECU signal access [In case `DcmDspDataUsePort` is set to {`USE_DATA_SENDER_RECEIVER`, `USE_DATA_SENDER_RECEIVER_AS_SERVICE`, `USE_BLOCK_ID`, `USE_ECU_SIGNAL`}, the usage of variable data length shall be not allowed.]()

[SWS_Dcm_CONSTR_6031] [The `DcmDspData.SHORT-NAME` and `DcmDspPidData.SHORT-NAME` shall be distinct.]()

Note: Variable data length is only possible with `UINT8` arrays with `DcmDspDataType` set to `UINT8_DYN`.

7.3.4.4 Dcm_OpStatusType

For the operation using the `Dcm_OpStatusType`, the `Dcm` shall work as follow :

[SWS_Dcm_00527] [At first call of an operation using the `Dcm_OpStatusType`, the `Dcm` call the operation with `OpStatus = DCM_INITIAL`.]()

[SWS_Dcm_00528] [If the value `DCM_E_FORCE_RCRRP` is returned from an operation using `Dcm_OpStatusType`, the `Dcm` shall invoke the transmit request for RCR-RP (NRC 0x78 transmission) and the `Dcm` shall not realize further invocation of the operation till RCR-RP is transmitted.]()

[SWS_Dcm_00529] [After transmit confirmation of a RCR-RP transmitted on the context of **[SWS_Dcm_00528]**, the `Dcm` calls, from `Dcm_MainFunction` (due to call context), the operation again with `OpStatus = DCM_FORCE_RCRRP_OK`.]()

[SWS_Dcm_00530] [If a `DCM_E_PENDING` value is returned from an operation using the `Dcm_OpStatusType`, the `Dcm` call the operation on each `Dcm_MainFunction` call with `OpStatus = DCM_PENDING` as long as `DCM_E_PENDING` is returned.]()

7.3.4.5 Dcm_Cemr_{DID}Type

For ease of use in SWC, the [Dcm](#) generates a symbolic name to access the [CEMR](#) bit according to [Dcm_Cemr_{DID}Type](#) (see [[SWS_Dcm_91087](#)]) for each data element used in a [DID](#) with IO control. The SWC can work only with the generated symbolic value of the bitfield text table to mask out a certain bit. This helps to avoid confusion, while the first [RID](#) bit on the network controls the first parameter of the [DID](#) but that Bit is the most significant Bit in the MSB. The symbolic name also helps if the size of the [RID](#) is changing. In that case the bitmask changes as well, but the symbolic value is always updated.

7.4 Diagnostic Session Layer (DSL)

7.4.1 Introduction

[SWS_Dcm_00030] [All functional areas of the [DSL](#) submodule shall be in conformance with the specifications ISO14229-1 [[1](#)], ISO14229-2 [[10](#)] and the network-independent part of ISO15765-3 [[4](#).] ([RS_Diag_04003](#), [RS_Diag_04015](#))

There is no network-dependent functional area in the [DSL](#) submodule. Within the configuration, some parameters can be set dependent on the network.

7.4.2 Use cases

The [DSL](#) submodule provides the following functionalities:

- Session handling (as required by ISO14229-1 [[1](#)] and ISO 15765-3 [[4](#)])
- Application layer timing handling (as required by ISO14229-1 [[1](#)] and ISO 15765-3 [[4](#)])
- Specific response behavior (as required by ISO14229-1 [[1](#)] and ISO 15765-3 [[4](#)])
- Authentication state handling per diagnostic connection (as required by ISO 14229-1:2018)
 - Provide authentication state per connection
 - Manage authentication state transitions

7.4.3 Interaction with other modules

The [DSL](#) has the following interaction with other modules:

- PduR module

- PduR module provides data of incoming diagnostic requests.
- The [DSL](#) submodule triggers output of diagnostic responses.
- [DSD](#) submodule
 - The [DSL](#) submodule informs the [DSD](#) submodule about incoming requests and provides the data.
 - The [DSD](#) submodule triggers output of diagnostic responses.
- SW-Cs / [DSP](#) submodule. The [DSL](#) submodule provides access to security and session state.
- ComM module
 - The [DSL](#) submodule guarantees the communication behavior required by the ComM module

7.4.4 Functional description

7.4.4.1 Overview

The [DSL](#) submodule provides the following functionality:

Request Handling

- Forward requests from the PduR module to the [DSD](#) submodule.
- [Concurrent TesterPresent](#) ("keep alive logic").

Response Handling

- Forward responses from the [DSD](#) submodule to the PduR module.
- Guarantee response timing to tester.
- Support of periodic transmission.
- Support of ResponseOnEvent (ROE) transmission.
- Support of segmented response.
- Support of ResponsePending response triggered by the application.

Security Level Handling

- Manage security level.

Session State Handling

- Manage session state.
- Keep track of active non-default sessions.

- Allows modifying timings.

Diagnostic Protocol Handling

- Handling of different diagnostic protocols.
- Manage resources.

Communication Mode Handling

- Handling of communication requirements (Full- / Silent- / No Communication).
- Indicating of active / inactive diagnostic.
- Enabling / disabling all kinds of diagnostic transmissions.

7.4.4.2 Forward requests from the PduR module to the **DSD** submodule

The PduR module indicates the **Dcm** module whenever a reception of new diagnostic request content is started on a **DcmDslProtocolRxPduId**, which is assigned to the **Dcm** module. This is done by calling **Dcm_StartOfReception**, which inform the **Dcm** module of the data size to be received and provides the data of the first frame or single frame, and allows the **Dcm** to reject the reception if the data size overflows its buffer size, or if the requested service is not available. The further call to **Dcm_CopyRxData** request the **Dcm** module to copy the data from the provided buffer to the **Dcm** buffer. If the reception of a diagnostic request is finished (when **Dcm_StartOfReception** succeeded) the PduR module will call **Dcm_TpRxIndication** to give a receive indication to the **Dcm** module. The **Dcm** shall be able to use generic connections, where the addressing information is provided to **Dcm** by **Dcm_StartOfReception** via the **MetaData** of the **DcmRxPdu**. This addressing information must be stored and used for the response and for detection of requests from the same tester. see section [7.4.4.5 Generic Connection Handling](#) for further details.

[SWS_Dcm_00111] [The **DSL** submodule shall forward received data to the **DSD** submodule only after a call of **Dcm_TpRxIndication** with parameter **Result = E_OK** (see [\[SWS_Dcm_00093\]](#)).] ([RS_Diag_04249](#))

[SWS_Dcm_00241] [As soon as a request message is received (after a call of **Dcm_TpRxIndication** with parameter **Result = E_OK** (see [\[SWS_Dcm_00093\]](#)) and until a call to **Dcm_TpTxConfirmation** (see [\[SWS_Dcm_00351\]](#)) for the associated **TxDcmPduld**), the **DSL** submodule shall block the corresponding **DcmPduld**. During the processing of this request, no other request of the same **DcmDslConnection** (e.g. an enhanced session can be ended by a **OBD** session) can be received, until the corresponding response message is sent and the **DcmPduld** is released again (except for **Concurrent TesterPresent** requests).] ()

More descriptions of the APIs (prototype, input/output parameter) can be found in the interface description of PduR module [\[11\]](#).

It is allowed to have different DcmPdulds for different diagnostic communication applications. For example:

- **OBD** `DcmDslProtocolRxPduId`: for reception of **OBD** requests,
- **OBD** `DcmTxPduld`: for transmission of **OBD** responses,
- **UDS phys** `DcmDslProtocolRxPduId`: for reception of **UDS** physically addressed requests,
- **UDS func** `DcmDslProtocolRxPduId`: for reception of **UDS** functionally addressed requests,
- **UDS** `DcmTxPduld`: for transmission of **UDS** responses.

Address type (physical/functional addressing) is configured per `DcmDslProtocolRxPduId`. A configuration per `DcmDslProtocolRxPduId` is possible because there will always be different `DcmDslProtocolRxPduId` values for functional and physical receptions, independent of the addressing format of the Transport Layer (extended addressing, normal addressing).

7.4.4.2.1 **Dcm_StartOfReception**

[SWS_Dcm_00444] [If the requested size is large than the buffer available in the DCM, the function `Dcm_StartOfReception` shall return `BUFREQ_E_OVFL` (see [\[SWS_Dcm_00094\]](#)).]()

[SWS_Dcm_00788] [When processing a diagnostic request and in case `DcmDslDiagRespOnSecondDeclinedRequest` is set to TRUE, the `Dcm` module shall return `BUFREQ_OK` on `Dcm_StartOfReception` received on new request using a different `DcmDslConnection`.]()

[SWS_Dcm_00789] [In case [\[SWS_Dcm_00788\]](#), the `Dcm` respond with a `NRC 0x21`]()

[SWS_Dcm_00790] [When processing a diagnostic request, the `Dcm` module shall reject (`Dcm_StartOfReception` shall return `BUFREQ_E_NOT_OK`) any new request using a different `DcmDslConnection` in case `DcmDslDiagRespOnSecondDeclinedRequest` is set to FALSE until the current diagnostic request processing is over.]()

[SWS_Dcm_00557] [When processing a diagnostic request, the `Dcm` module shall reject (`Dcm_StartOfReception` shall return `BUFREQ_E_NOT_OK`) any new diagnostic request with the same `DcmDslConnection` until the current diagnostic request processing is over. `Concurrent TesterPresent` requests will be accepted with a `BUFREQ_OK`, but not further processed, as the running diagnostic request already resets the session timeout timer (S3Server).] ([RS_Diag_04249](#))

[SWS_Dcm_01145] [If the current session is a non-default session and a `Concurrent TesterPresent` received on a different `DcmDslConnection`, this request will

be accepted with a BUFREQ_OK, but not further processed. E.g. it is not resetting the session timeout timer (S3Server).] ([RS_Diag_04249](#))

[SWS_Dcm_01146] [In case of [SWS_Dcm_01145] with reception on a higher priority protocol, this will not lead to protocol preemption.]()

[SWS_Dcm_00642] [When the [API Dcm_StartOfReception](#) is invoked with TpSd-uLength equal to 0, the value BUFREQ_E_NOT_OK shall be returned and no further action shall be taken.] ([RS_Diag_04147](#))

[SWS_Dcm_00655] [If the current session is a non-default session and a new diagnostic request with same or lower priority protocol than active one is detected, the [Dcm](#) shall act according [SWS_Dcm_00788], [SWS_Dcm_00789] and [SWS_Dcm_00790].]()

[SWS_Dcm_00656] [If the current session is the default session and a diagnostic request is in execution, for any new diagnostic request with same or lower priority protocol than active one, the [Dcm](#) shall act according [SWS_Dcm_00788], [SWS_Dcm_00789] and [SWS_Dcm_00790].]()

7.4.4.2.2 Dcm_CopyRxData

[SWS_Dcm_00443] [If [Dcm_StartOfReception](#) returns BUFREQ_OK, the further call to [Dcm_CopyRxData](#) shall copy the data from the buffer provided in info parameter) to the [Dcm](#) buffer and update the bufferSizePtr parameter with remaining free place in [Dcm](#) receive buffer after completion of this call.]()

[SWS_Dcm_00996] [When the [API Dcm_CopyRxData](#) is invoked with SduLength from info equal to 0, the value BUFREQ_OK shall be returned and bufferSizePtr shall be filled with the remaining size of the Rx buffer.]()

Note: The size of the Rx buffer is based on the buffer length, which is returned in the parameter RxBufferSizePtr of [API Dcm_StartOfReception](#). **[SWS_Dcm_00342]** [After starting to copy the received data (see [SWS_Dcm_00443]), the [Dcm](#) module shall not access the receive buffer until it is notified by the service [Dcm_TpRxIndication](#) about the successful completion or unsuccessful termination of the reception.]()

Note: [Dcm_TpRxIndication](#) is only expected when [Dcm_StartOfReception](#) succeeded

7.4.4.2.3 Dcm_TpRxIndication

[SWS_Dcm_00344] [If [Dcm_TpRxIndication](#) is called with parameter Result different from E_OK, then the [Dcm](#) module shall not evaluate the buffer assigned to the I-PDU, which is referenced in parameter DcmRxPdulId.]()

Rationale for [SWS_Dcm_00344]: It is undefined which part of the buffer contains valid data in this case

7.4.4.3 **Concurrent TesterPresent ("keep alive logic")**

It is possible, that functional "TesterPresent" commands are sent by the tester in parallel to physical requests/responses. This is called "keep alive logic" in ISO14229-1 [1]. This functional "TesterPresent" will be received on a separate `DcmDslProtocolRxPduId` belonging to a `DcmDslProtocolRxPduId` RxConnection which has `DcmDslProtocolRxAddrType` configured as DCM_FUNCTIONAL_TYPE, which is belonging to the same `DcmDslConnection` as the physical request. A Dcm-internal receive buffer which is not configured explicitly, is used in this case. Due to that reason, the functional TesterPresent (and only functional TesterPresent without response) is handled in the following way:

[SWS_Dcm_00112] [When the PduR module calls `Dcm_TpRxIndication` with parameter Result=E_OK (see [SWS_Dcm_00093]) and if the request is a "TesterPresent" command with "suppressPosRspMsgIndicationBit" set to TRUE (SID equal to 0x3E, subfunction equal to 0x80), the `DSL` submodule shall reset the session timeout timer (S3Server).] (*RS_Diag_04249*)

[SWS_Dcm_00113] [When the PduR module calls `Dcm_TpRxIndication` with parameter Result = E_OK (see [SWS_Dcm_00093]) and if the request is a "TesterPresent" command with "suppressPosRspMsgIndicationBit" set to TRUE (SID equal to 0x3E, subfunction equal to 0x80), the `DSL` submodule shall not forward this request to the `DSD` submodule for further interpretation.]()

Rationale for [SWS_Dcm_00113]: Because of bypassing the functional "TesterPresent" in the `DSL` submodule, the `Dcm` module is able to receive and process next physical requests without any delay.

[SWS_Dcm_01168] [The `Dcm` shall handle a tester present request as concurrent request only if it was received on a functional address with "suppressPosRspMsgIndicationBit" set to TRUE.]()

7.4.4.3.1 **Dcm_CopyTxData**

If the copied data is smaller than the length requested to transmit within the service `PduR_DcmTransmit()` the `Dcm` module will be requested by the service `Dcm_CopyTxData` to provide another data when the current copied data have been transmitted.

[SWS_Dcm_00346] [If the function `Dcm_CopyTxData` is called and the `Dcm` module successfully copied the data in the buffer provided in info parameter, then the function shall return `BUFREQ_OK`.]()

[SWS_Dcm_00350] [Caveats of `Dcm_CopyTxData`:

- The value of parameter availableDataPtr of function `Dcm_CopyTxData` shall not exceed the number of Bytes still to be sent.
- If this service returns `BUFREQ_E_NOT_OK` the transmit requests issued by calling the service `PduR_DcmTransmit()` is still not finished. A final confirmation (indicating an error with call of service `Dcm_TpTxConfirmation`) is required to finish this service and to be able to start another transmission (call to `PduR_DcmTransmit()`). So it is up to the transport protocol to confirm the abort of transmission.

]()

7.4.4.3.2 `Dcm_TpTxConfirmation`

[SWS_Dcm_00352] [If the function `Dcm_TpTxConfirmation` is called, then the `Dcm` module shall unlock the transmit buffer.]()

[SWS_Dcm_00353] [If the function `Dcm_TpTxConfirmation` is called, then the `Dcm` module shall stop error handling (Page buffer timeout, `P2ServerMax/P2*ServerMax` timeout).]()

For transmission via FlexRay the following restriction has to be considered: Since the FlexRay Specification does not mandate the existence of a transmit interrupt, the exact meaning of this confirmation (i.e. "transfer into the FlexRay controller's send buffer" OR "transmission onto the FlexRay network") depends on the capabilities of the FlexRay communication controller and the configuration of the FlexRay Interface.

7.4.4.4 Forward responses from the `DSD` submodule to the `PduR` module

[SWS_Dcm_00114] [The `DSD` submodule shall request the `DSL` submodule for transmission of responses.] (*RS_Diag_04249*)

[SWS_Dcm_00115] [When the diagnostic response of a `DcmDslMainConnection` is ready, the `DSL` submodule shall trigger the transmission of the diagnostic response to the `PduR` module by calling `PduR_DcmTransmit()` using the corresponding `DcmDslProtocolTxPduRef` parameter as `Pduld`.] (*RS_Diag_04249*)

[SWS_Dcm_01072] [In case of PeriodicTransmission, the `Dcm` shall provide in the call to `PduR_DcmTransmit()` the full payload data and expect no call to `Dcm_CopyTxData`.]()

[SWS_Dcm_01073] [In case of PeriodicTransmission, the `Dcm` will be called for periodic transmission with `Dcm_TxConfirmation` to indicate the transmission result.] (*RS_Diag_04249*)

Responses are sent with the `DcmTxPduld`, which is linked in the `Dcm` module configuration to the `DcmDslProtocolRxPduId`, i.e. the `ID` the request was received with (see

configuration parameter `DcmDslProtocolTx`) Within `PduR_DcmTransmit()` only the length information and, for generic connections, the addressing information, is given to the `PduR` module. After the `Dcm` module has called successfully `PduR_DcmTransmit()`, the `PduR` module will call `Dcm_CopyTxData` to request the `Dcm` module to provide the data to be transmitted and will call `Dcm_TpTxConfirmation` after the complete `PDU` has successfully been transmitted or an error occurred. see section [7.4.4.5 "Generic Connection Handling](#) for further details on address information handling within generic connections".

[SWS_Dcm_00117] [If the `DSL` submodule receives a confirmation after the complete `Dcm PDU` has successfully been transmitted or an error occurred by a call of `Dcm_TpTxConfirmation`, then the `DSL` submodule shall forward this confirmation to the `DSD` submodule.] ([RS_Diag_04249](#))

[SWS_Dcm_00118] [In case of a failed transmission (failed `PduR_DcmTransmit()` request) or error confirmation (`Dcm_TpTxConfirmation` with error), the `DSD` submodule shall not repeat the diagnostic response transmission.] ()

Note: `Dcm_TpTxConfirmation` is only expected when `PduR_DcmTransmit` succeeded.

[SWS_Dcm_01166] [If the Multiplicity of `DcmDslProtocolTx` is set to "0" the `Dcm` shall process the received diagnostic request without sending a response.] ()

More descriptions of the APIs (prototype, input/output parameter) can be found in the interface description of the `PduR` module [\[11\]](#).

7.4.4.5 Generic Connection Handling

The `Dcm` shall be able to handle generic connections, identified by `DcmPdus` with `Meta-DataItems` of type `SOURCE_ADDRESS_16` and `TARGET_ADDRESS_16`. These connections carry the actual tester address at run time. Please note that this address is not provided to the application. If the application needs to discern different testers, separate connections have to be created. Generic connections are supported for diagnostics over IP and FlexRay diagnostics, and `CAN` diagnostics using normal fixed or mixed 29 bit addressing formats according to ISO15765-2 [\[12\]](#). Depending on the actual layout of the `CAN` IDs, generic connections could also be used for extended or normal and mixed 11 bit addressing formats. The `Dcm` is not aware of the actual addressing format used by `CanTp`. Several connections may reference the same `DcmPdus`.

[SWS_Dcm_CONSTR_6044] [Generic connections shall be consistent. This means that the `Meta-DataItems` and the `PduLength` of all referenced PDUs of a `DcmDslConnection` (`DcmDslProtocolRxPduRef`, `DcmDslProtocolTxPduRef`, `DcmDslPeriodicTxPduRef`, `DcmDslRoeTxPduRef`) are identical.] ()

[SWS_Dcm_00848] [The source address of diagnostic requests received via a generic connection must be stored. It is provided in the `Meta-DataItem` `SOURCE_ADDRESS_16` provided via `Dcm_StartOfReception`.] ()

[SWS_Dcm_00849] Target address for generic connection transmission [If the [Dcm](#) is about to send a response, response on event, or periodic message for a generic connection request, the [Dcm](#) shall set TARGET_ADDRESS_16 to the value of the stored source address in the [MetaDataTable](#) in the [PduR_DcmTransmit\(\)](#).] ([RS_Diag_04153](#))

[SWS_Dcm_01429] [The source address of diagnostic requests received via a generic connection shall be provided in the parameter [TesterSourceAddress](#) to the application [\[SWS_Dcm_01339\]](#), [\[SWS_Dcm_01340\]](#), [\[SWS_Dcm_01341\]](#), [\[SWS_Dcm_01342\]](#), [\[SWS_Dcm_00692\]](#), [\[SWS_Dcm_00694\]](#), [\[SWS_Dcm_00340\]](#), [\[SWS_Dcm_00698\]](#).] ()

[SWS_Dcm_01347] [The target address of diagnostic requests received via a generic connection can be provided in the [MetaDataTable](#) TARGET_ADDRESS_16 received via [Dcm_StartOfReception\(\)](#). In this case, the [Dcm](#) shall ignore physical requests where the target address is not equal to the configured ECU address [DcmDspProtocolEcuAddr](#).] ([RS_Diag_04153](#))

[SWS_Dcm_01348] [The source address of the response transmitted via generic connections can be read from the configuration parameter [DcmDspProtocolEcuAddr](#). It shall be provided to [PduR_DcmTransmit\(\)](#) in the [MetaDataTable](#) SOURCE_ADDRESS_16, if that is configured for the transmit PDU.] ([RS_Diag_04153](#))

Note: If different source addresses are required for certain transmitted diagnostic messages of the same [DcmDslProtocolRow](#), the [MetaDataTable](#) SOURCE_ADDRESS_16 can be omitted from the PDUs, and the address can then be configured in the lower layers. The same is possible for physical requests, where the TARGET_ADDRESS_16 can be omitted from the PDUs.

7.4.4.6 Guarantee timing to tester by sending busy responses

[SWS_Dcm_00024] [If the Application (or the [DSP](#) submodule) is able to perform a requested diagnostic task, but needs additional time to finish the task and prepare the response, then the [DSL](#) submodule shall send a negative response with [NRC](#) 0x78 (Response pending) when reaching the response time ([DcmDspSessionP2ServerMax - DcmTimStrP2ServerAdjust](#) respectively [DcmDspSessionP2StarServerMax - DcmTimStrP2StarServerAdjust](#)).] ([RS_Diag_04016](#), [RS_Diag_04249](#))

Rationale for [\[SWS_Dcm_00024\]](#): The [DSL](#) submodule guarantees the response timing to tester.

[SWS_Dcm_00119] [The [DSL](#) submodule shall send negative responses as required in [\[SWS_Dcm_00024\]](#) from a separate buffer.] ()

Rationale for [\[SWS_Dcm_00119\]](#): This is needed in order to avoid overwriting the ongoing processing of requests, e.g. the application already prepared response contents in the diagnostic buffer. The number of negative responses with [NRC](#) 0x78 (response pending) for one diagnostic request can be limited by the configuration parameter

[DcmDslDiagRespMaxNumRespPend](#) to avoid endless [NRC](#) 0x78 transmission in case of an application deadlock.

[SWS_Dcm_01567] [The maximum number of negative responses with [NRC](#) 0x78 can be configured using the optional configuration parameter [DcmDslDiagRespMaxNumRespPend](#) (see [ECUC_Dcm_00693](#)). If this parameter is not configured, the default amount of negative responses with [NRC](#) 0x78 is infinite.]()

7.4.4.7 Support of periodic transmission

The [UDS](#) service [ReadDataByPeriodicIdentifier](#) (0x2A) allows the tester to request the periodic transmission of data record values from the ECU identified by one or more [periodicDataIdentifiers](#).

[SWS_Dcm_00122] [The [Dcm](#) module shall send responses for periodic transmissions using a separate protocol and a separate buffer of configurable size.]()

The [DcmDslPeriodicTransmissionConRef](#) configuration parameter allows linking the protocol used to receive the periodic transmission request / transmit the periodic transmission response to the protocol used for the transmission of the periodic transmission messages. Note that multiple [DcmTxPdulds](#) can be assigned to the periodic transmission protocol. The [Dcm](#) module respects several restrictions according to the communication mode:

[SWS_Dcm_00123] [Periodic transmission communication shall only take place in Full Communication Mode.]()

Periodic transmission events can occur when not in Full Communication Mode. So the following requirement exists:

[SWS_Dcm_00125] [The [Dcm](#) module shall discard periodic transmission events beside Full Communication Mode and shall not queue it for transmission.]()

[SWS_Dcm_00126] [Periodic transmission events shall not activate the Full Communication Mode.]()

7.4.4.8 Support of [ROE](#) transmission

With the [UDS](#) Service [ResponseOnEvent](#) (0x86), a tester requests an ECU to start or stop transmission of responses initiated by a specified event. Upon registering an event for transmission, the tester also specifies the corresponding service to respond to (e.g: [UDS](#) Service [ReadDataByIdentifier](#) 0x22).

[SWS_Dcm_00595] [The [ROE](#) functionality is enabled only if the container [DcmDslResponseOnEvent](#) exists.]()

7.4.4.8.1 ResponseOnEvent StateChar

[SWS_Dcm_00871] [The [Dcm](#) shall support several RoeEvents. Each RoeEvent can have the states "ROE cleared", "ROE stopped" and "ROE started". The transitions from state to state are described in the following section. The Labels in the figure below represents the numbers of the sections.]()

Figure 7.4: RoeEvent State Chart

7.4.4.8.1.1 Initializing [Dcm](#) (1)

[SWS_Dcm_00872] [The [Dcm](#) changes the state of each event to 'ROE cleared' state during [Dcm_Init.](#).]()

7.4.4.8.1.2 Transition from 'ROE cleared' to 'ROE stopped' (2)

[SWS_Dcm_00873] [By receiving a valid [ROE](#) setup request, the RoeEvent which is addressed in the request changes to the 'ROE stopped' state (see Table 2).]()

[SWS_Dcm_00874] [If the RoeEvent was setup with the StorageState set to 'storeEvent' and no StartResponseOnEvent with StorageState set to 'storeEvent' and an EventWindowTime which is active over power cycles or clearResponseOnEvent has been received afterwards the [Dcm](#) will change to 'ROE stopped' state as soon as the non-volatile information is available.]()

Note: If an Event is initialized once with StorageState set to 'StoreEvent', it will stay initialized until it is cleared by a ClearResponseOnEvent request (see also [\[SWS_Dcm_00897\]](#)).

[SWS_Dcm_00951] [If for a RoeEvent the configuration parameter [DcmDspRoeInitialEventStatus](#) is set to [DCM_ROE_STOPPED](#), the [Dcm](#) will switch to 'ROE stopped' state immediatly in the initialisation.]()

Note: [DcmDspRoeInitialEventStatus](#) set defines an initialisation of a RoeEvent by configuration.

7.4.4.8.1.3 Transition from 'ROE stopped' to 'ROE cleared' (3)

[SWS_Dcm_00875] [By receiving a valid [ROE](#) request with the sub-function clear-ResponseOnEvent (0x06) the RoeEvents change to the 'ROE cleared' state.]()

7.4.4.8.1.4 Transition from 'ROE stopped' to 'ROE started' (4)

[SWS_Dcm_00876] [By receiving a valid [ROE](#) request with the sub-function startResponseOnEvent (0x05) all stopped RoeEvents change to the 'ROE started' state.]()

[SWS_Dcm_00902] [All RoeEvents which have been in 'ROE started' state when leaving the default session shall change back into 'ROE started' state when (re-) entering the default session.]()

[SWS_Dcm_00965] [If a valid StartResponseOnEvent request is received with a storageState set to StoreEvent and the EventWindowTime supports the StorageState in a previous power cycle, the RoeEvent shall change from 'ROE stopped' state to 'ROE started' state as soon as the non-volatile data is available. (This ROEEvent was set to 'ROE stopped' according to [\[SWS_Dcm_00951\]](#)).]()

7.4.4.8.1.5 Transition from 'ROE started' to 'ROE stopped' (5)

[SWS_Dcm_00877] [By receiving a valid [ROE](#) request with the sub-function stopResponseOnEvent (0x00) the stopped RoeEvents change to the 'ROE stopped' state.]()

[SWS_Dcm_00878] [When the eventWindowTime times out the stopped RoeEvents change to the 'ROE stopped' state.]()

[SWS_Dcm_00879] [By leaving the current session all started RoeEvents shall change to the 'ROE stopped' state.]()

Note: RoeEvents are stopped when the current session is left, independent if the session changes from a non-default session to the same or a different non-default session. By leaving the default session the current active RoeEvents are stopped and stored (in order to be re-started as soon the session changes back to the default session (see [\[SWS_Dcm_00902\]](#))).

[SWS_Dcm_00952] [If a [ROE](#) request is received with the sub-function OnDTCStatusChange and the RoeEvent is 'ROE started', the RoeEvent for OnDTCStatusChange changes to 'ROE stopped' state and the ServiceToRespondTo shall be triggered by the DTCStatusMask which is set by the new request.]()

7.4.4.8.1.6 Transition from 'ROE started' to 'ROE started' (6)

[SWS_Dcm_00880] [By receiving a valid [ROE](#) request with the sub-function StartResponseOnEvent (0x05) the [Dcm](#) answers positively and stays in 'ROE started' state.].()

7.4.4.8.1.7 Transition from 'ROE started' to 'ROE cleared' (7)

[SWS_Dcm_00884] [By receiving a valid [ROE](#) request with the sub-function clearResponseOnEvent (0x06) all started RoeEvents change to the 'ROE cleared' state.].()

7.4.4.8.1.8 Transition from 'ROE cleared' to 'ROE cleared' (8)

[SWS_Dcm_00885] [If all RoeEvents are in 'ROE cleared' state and a valid stopResponseOnEvent (0x00) request is received the [Dcm](#) shall reject the request with a negative Response with [NRC](#) 0x24 (requestSequenceError).].()

[SWS_Dcm_00886] [If all RoeEvents are in 'ROE cleared' state and a valid StartResponseOnEvent (0x05) request is received the [Dcm](#) shall reject the request with a negative Response with [NRC](#) 0x24 (requestSequenceError).].()

[SWS_Dcm_00887] [If all RoeEvents are in 'ROE cleared' state and a valid clearResponseOnEvent (0x06) request is received the [Dcm](#) answers positively and the RoeEvents stay in 'ROE cleared' state.].()

[SWS_Dcm_00888] [If the non-volatile data could not be read correctly, all RoeEvents in 'ROE cleared' state remain in 'ROE cleared' state.].()

7.4.4.8.1.9 Transition from 'ROE cleared' to 'ROE started' (9)

[SWS_Dcm_00889] [If the EventWindowTime is active over power cycles and not timed out, the [Dcm](#) shall reactivate all RoeEvents which were active in the default session during the last power cycle as soon as the non-volatile information is available.].()

[SWS_Dcm_00890] [If a valid StartResponseOnEvent request is received with a storageState set to StoreEvent and the EventWindowTime supports the StorageState in a

previous power cycle, the RoeEvent shall change to 'ROE started' state as soon as the non-volatile data is available.]()

7.4.4.8.1.10 Transition from 'ROE stopped' to 'ROE stopped' (10)

[SWS_Dcm_00891] [If a RoeEvent is in 'ROE stopped' state and a valid stopResponseOnEvent (0x00) request is received the [Dcm](#) shall respond positively to the request and stay in the 'ROE stopped' state.]()

[SWS_Dcm_00953] [If a [ROE](#) request is received with the sub-function OnDTCStatusChange and the RoeEvent is already 'ROE stopped' the RoeEvent for OnDTCStatusChange shall stay in 'ROE stopped' state but the event logic shall be updated with the newly received DTCStatusMask.]()

7.4.4.8.2 ROE sub-functions

[SWS_Dcm_00892] [The [Dcm](#) shall support all [ROE](#) sub-functions marked as supported in Table 7.1.]()

Sub function ID	Sub-function name	Kind of sub-function	ServiceTo RespondTo	Support status
0x00/0x40	stopResponseOnEvent	Control		Supported
0x01/0x41	onDTCStatusChange	Setup	0x19, 0x0E	Supported
0x02/0x42	onTimerInterrupt	Setup		Not supported
0x03/0x43	onChangeOfDataIdentifier	Setup	0x22	Supported
0x04	reportActivatedEvents	Control		Supported
0x05/0x45	StartResponseOnEvent	Control		Supported
0x06/0x46	clearResponseOnEvent	Control		Supported
0x07/0x47	onComparisonOfValues	Setup		Not supported
Other	OEM Specific	Setup		Not supported

Table 7.1: Supported sub function of Response on Event (0x86)

Note: If a user wants to support a sub-function with StorageState bit set, then it has to be explicitly configured in the [DSD](#). The [Dcm](#) will not mask the StorageState bit internally.

[SWS_Dcm_00893] [For each setup sub function the [Dcm](#) shall only support the one fixed ServiceToRespondTo. The supported ServiceToRespondTo is listed in the table referred in [\[SWS_Dcm_00892\]](#).]()

7.4.4.8.3 EventWindowTime and StorageState

The EventWindowTime and StorageState are mandatory parameter in every [ROE](#) request. They can be contradicting between the setup request and the related control request.

[SWS_Dcm_00903] [The [Dcm](#) shall evaluate the EventWindowTime from the setup request.]()

[SWS_Dcm_00894] [The [Dcm](#) shall support in general the EventWindowTimes defined in Table 7.2.]()

Value	Name	Active over PowerCycles
0x02	Infinity	Storage State
0x03	CurrentCycle	No
0x04	CurrentAndFollowingCycle	Yes

Table 7.2: Supported [ROE](#) EventWindowTime

[SWS_Dcm_00895] [The configuration parameter [DcmDspRoeEventWindowTime](#) shall contain a list of all EventWindowTimes supported for this specific Ecu.]()

[SWS_Dcm_00896] [If the Roe request contains a different EventWindowTime than configured in [DcmDspRoeEventWindowTime](#) the [Dcm](#) shall reject the request with a negative response with the [NRC](#) 0x31 (RequestOutOfRange).]()

[SWS_Dcm_01076] [If the Roe request has a storageState equal to storeEvent and contains an EventWindowTime that is not infinite, the [Dcm](#) shall reject the request with a negative response with the [NRC](#) 0x31 (RequestOutOfRange).]()

[SWS_Dcm_00897] [If a RoeEvent is setup with StorageState set to storeEvent the initialization shall be stored non-volatile to be restored in every following driving cycle until it is cleared (see [\[SWS_Dcm_00874\]](#)).]()

[SWS_Dcm_00898] [A RoeEvent shall change to 'ROE started' state at the beginning of each following power cycle until a stopResponseOnEvent request with storage StorageState set to StoreEvent is received if the RoeEvent fulfills all following conditions :

- The RoeEvent was started in default session
- The StartResponseOnEventRequest has a storageState set to 'StoreEvent'
- The setup request has the EventWindowTime infinity and the storageState was set to 'StoreEvent'.

]()

[SWS_Dcm_00905] [The EventWindowTime will end at the end of the current power cycle if all of the following conditions are fulfilled:

- The EventWindowTime is set to infinity (0x02) during the setup request
- The RoeEvent was started in default-session
- The storageState was not set in the StartResponseOnEvent request

]()

[SWS_Dcm_00900] [If a RoeEvent set up with the EventWindowTime set to CurrentAndFollowingCycle is started in default session, the EventWindowTime shall end at the end of the next power cycle or with a clearResponseOnEvent/stopResponseOnEvent request.]()

[SWS_Dcm_00901] [If a RoeEvent set up with the EventWindowTime set to CurrentCycle is started in default session, the EventWindowTime shall end at the end of the current power cycle or with a clearResponseOnEvent/stopResponseOnEvent.]()

[SWS_Dcm_00906] [If ResponseOnEvent is started in a non-default session, the EventWindowTime ends if one of the following conditions is fulfilled:

- The power cycle ends
- Receiving a clearResponseOnEvent request
- Receiving a stopResponseOnEvent request
- With any session change.

]()

[SWS_Dcm_00907] [If the EventWindowTime times out and the power cycle is not ended, the [Dcm](#) shall send a final positive Response to the setup request.]()

For the EventWindowTime infinity (0x02), ThisCycle (0x03), ThisAndNextCycle (0x04) the [Dcm](#) will not send a final response because these EventWindow Times will end at the end of an power cycle. There will also no final response if the session changes or the service is stopped with a 'stopResponseOnEvent' subfunction.

7.4.4.8.4 Pre-configuration of ResponseOnEvent

[SWS_Dcm_00908] [The [Dcm](#) shall only support Roe requests which where pre-configured in the configuration.]()

Note: The pre-configuration gives the [Dcm](#) the freedom to optimized not configured requests.

[SWS_Dcm_00909] [The [Dcm](#) supports the configuration container [DcmDspRoe](#) to configure all supported ResponseOnEvent setup requests.]()

[SWS_Dcm_00954] Pre-configuration of ROE events [If [DcmDspRoeInitialEventStatus](#) is set to [DCM_ROE_STOPPED](#), the [Dcm](#) shall behave according RoeEvent set-up:

- StorageState set to "StoreEvent"
- EventWindowTime set to "infinity"
- DTCStatusMask set to value configured in [DcmDspRoeDTCStatusMask](#) in case of onDTCStatusChange and

- `DID` set to the value given with `DcmDspRoeDidRef` in case of `onChangeOfDataIdentifier`

]()

[SWS_Dcm_01323] [Likewise, when responding to the `reportActivatedEvents` (0x04) subfunction of the `ResponseOnEvent` (0x86) service, preconfigured events shall have the `storageState` bit set within the corresponding `eventTypeOfActiveEvent` byte.]()

According to [SWS_Dcm_00954] and [SWS_Dcm_00897], the pre-configuration of RoeEvents shall behave the same like received a received setup and start request in previous driving cycles. If the `storageState` is set in the `start/stop/clearedResponseOnEventRequest` the pre configuration will be replaced with the newly received request.

7.4.4.8.5 Handling of event-trigger

7.4.4.8.5.1 ROE event-trigger onDTCStatusChange (0x01)

If a RoeEvent is in 'ROE started' state and it is configured to `onDTCStatusChange` (see container `DcmDspRoeEvent`), the `Dcm` triggers a `ServiceToResponseTo` as soon as the `Dem` is reporting a `DTCStatusChange` which fits to the requested `DTCStatusMask`. According to [SWS_Dcm_00909], the `Dcm` only supports preconfigured `ROE` requests. Therefore the container `DcmDspRoeOnDTCStatusChange` needs to be configured if `onDTCStatusChange` shall be used.

[SWS_Dcm_00912] [If the state of one RoeEvent that is configured for `onDTCStatusChange` changes to 'ROE started' the `Dcm` shall evaluate the callback `Dcm_DemTriggerOnDTCStatus`.]()

[SWS_Dcm_00913] [If the state of the RoeEvent, configured to `OnDTCStatusChange`, leaves 'ROE started' the `Dcm` shall ignore the callback `Dcm_DemTriggerOnDTCStatus`.]()

[SWS_Dcm_01410] [In case a request to clear the `EventMemory` is processed, the `Dcm` shall ignore the callback `Dcm_DemTriggerOnDTCStatus`.]()

[SWS_Dcm_00914] [If the state of the RoeEvent is 'ROE started' for the subfunction `OnDTCStatusChange` shall trigger a `serviceToRespondTo` if `Dcm_DemTriggerOnDTCStatus` is called and the `DTCStatusNew` fits to the corresponding `DTCStatusMask`.]()

[SWS_Dcm_00915] [If an event is trigger for `onDTCStatusChange`, the `Dcm` shall execute a `serviceToResponseTo` 0x19 0x0E, if the `DTCStatusNew` fits to the corresponding `DTCStatusMask`.]()

[SWS_Dcm_CONSTR_6054] Existence of DTCStatusMask [`DcmDspRoeDTCStatusMask` shall be present if `DcmDspRoeInitialEventStatus` is set to `DCM_ROE_STOPPED`.]()

7.4.4.8.5.2 ROE event-trigger onChangeOfDataIdentifier (0x03)

If a RoeEvent is in 'ROE started' state and it is configured to onChangeOfDataIdentifier (see container [DcmDspRoeEvent](#)) , the [Dcm](#) triggers a ServiceToResponseTo as soon as a SWC or a CDD is reporting a change of the [DID](#) referenced by [DcmDspRoeDidRef](#) (SWC or CCD reports [DID](#) change by call of [Dcm_TriggerOnEvent](#)). According to [\[SWS_Dcm_00909\]](#), the [Dcm](#) only supports preconfigured [ROE](#) requests. Therefore the Did in the [ROE](#) setup request with onChangeOfDataIdentifier has to be linked as [DcmDspRoeDidRef](#) in the onChangeOfDataIdentifier configuration.

[SWS_Dcm_00918] [If a ResponseOnEvent is requested as onChangeOfDataIdentifier and the requested Did is not referred as [DcmDspRoeDidRef](#) for any [DcmDspRoeEvent](#) the [Dcm](#) shall reject the request with a negative response with [NRC](#) 0x31 RequestOutOfRange.]()

[SWS_Dcm_00920] [If [Dcm_TriggerOnEvent](#) is called and the passed RoeEvent is active, the [Dcm](#) shall trigger an Event for this RoeEvent.]()

[SWS_Dcm_00921] [If an event is triggered for onChangeOfDataIdentifier, the [Dcm](#) shall execute a serviceToResponseTo 0x22 with the Did which is referred for this RoeEvent ([DcmDspRoeDidRef](#)) .]()

7.4.4.8.6 Trigger a ServiceToRespondTo

[SWS_Dcm_00922] [If a ServiceToRespondTo is triggered by a RoeEvent the [Dcm](#) shall execute the ServiceToRespondTo as normal diagnostic service according to the figure 'General server response behavior' of ISO14229-1 [\[1\]](#).]()

[SWS_Dcm_00558] [If a ServiceToRespondTo is triggered while the [Dcm](#) is already executing a request on a different diagnostic Protocol the [Dcm](#) shall postpone the ServiceToRespondTo until the execution of the service is finalized.]()

[SWS_Dcm_00923] [The [Dcm](#) shall only process the last ServiceToRespondTo. If already a ServiceToRespondTo is postponed due to another service execution the new respond shall overwrite the previous trigger.]()

[SWS_Dcm_00924] [If a ServiceToRespondTo is executed while a Request on a different diagnostic protocol is received the ServiceToRespondTo shall be canceled.]()

[SWS_Dcm_00925] [If ServiceToRespondTo are pending when the RoeEvent changes to the 'ROE cleared' state or 'ROE stopped' state the pending RoeEvent will be removed.]()

[SWS_Dcm_00127] [If the [UDS](#) service ResponseOnEvent (0x86) is received with the subservice StartResponseOnEvent, then the [DSP](#) sub-module shall store the respective configured connectionId of the received RxPdul for all RoeEvents which will be started until the eventWindowTime times out.]()

[SWS_Dcm_00128] [The [DSP](#) submodule shall forward this stored connectionId as parameter in the [DslInternal_ResponseOnOneEvent\(\)](#) function, where it is used to trigger a [serviceToRespondTo](#).]()

Note: The [Dcm](#) stores the connectionId of the protocol where the [ROE](#) request is received, independent if the [serviceToResponseTo](#) is sent to a same or a different TxPduld. The connectionId links always the correct TxPduld, because there is only one TxPduld for [ServiceToRespondTo](#) linked to one protocol (see [ConfigurationParameter DcmDslROEConnectionRef](#)). If RoeEvents are active over power cycles the connectionId needs to be stored over power cycles.

7.4.4.8.7 Send a [ServiceToRespondTo](#)

The [Dcm](#) supports the transmission from [ServiceToResponseTo](#) on the same TxPduld like the [ROE](#) response is send (TYPE 1) or on a different TxPduld (TYPE 2).

[SWS_Dcm_00131] [The configured protocol buffer shall be used for transmission of the [ROE](#) messages (as the reception shall use a separate protocol, a separate buffer needs to be used for reception).]()

[SWS_Dcm_00926] [If a [ROE](#) request is received on a protocol [DcmDslMainConnection](#), the [Dcm](#) shall send the [ServiceToRespondTo](#) on the protocol which is referred as [DcmDslROEConnectionRef](#).]()

Note: if the [EventWindowTime](#) is active over more than this power cycle, the [Dcm](#) has to store the protocol where the event was started.**[SWS_Dcm_00927]** [If the referred Protocol for [ResponseOnEvent](#) ([DcmDslROEConnectionRef](#)) is configured for TYPE1 the [Dcm](#) shall send the [ServiceToRespondTo](#) to the same TxPdulID as the [ROE](#) response is send to.]()

[SWS_Dcm_00928] [If the referred Protocol for [ResponseOnEvent](#) ([DcmDslROEConnectionRef](#)) is configured for TYPE2 the [Dcm](#) shall send the [ServiceToRespondTo](#) to the configured TxPdulID (see configuration parameter [DcmDslRoeTxPduRef](#)).]()

[SWS_Dcm_00132] [The content of the [pMsgContext](#) pointer ([ROE](#) message) shall be copied into the buffer.]()

[SWS_Dcm_00133] [[ROE](#) communication shall only be performed in Full Communication Mode. The [Dcm](#) shall check the communication mode of the [DcmDslProtocol-ComMChannelRef](#) in the [DcmDslMainConnection](#).]()

[SWS_Dcm_00134] [[ROE](#) events shall be disabled in any other Communication Mode except for the Full Communication Mode.]()

[SWS_Dcm_00135] [[ROE](#) events occurring in a communication mode different from Full Communication Mode shall be discarded and not queued for later transmission.]()

[SWS_Dcm_00136] [[ROE](#) events requested by the Application shall not activate the Full Communication Mode.]()

[SWS_Dcm_01534] Authentication check for service to respond to [On transmission of the service to respond to, the Dcm shall perform the service authentication checks and send a positive response only for services that have granted access to that connection.] (*RS_Diag_04230*)

[SWS_Dcm_CONSTR_6025] Reference to `DcmDslResponseOnEvent` connection [Only one `DcmDslROEConnectionRef` shall reference `DcmDslResponseOnEvent` connection.] ()

[SWS_Dcm_CONSTR_6056] Dependency for `DcmDslProtocolTransType` [`DcmDslProtocolTransType` shall be only present if the `Dcm_ProtocolType` is configured to `DCM_ROE_ON_CAN` or `DCM_ROE_ON_FLEXRAY` or `DCM_ROE_ON_IP`.] ()

7.4.4.8.7.1 Roe transmission cycle

[SWS_Dcm_00601] [The `Dcm` module shall respect a minimum time between two (2) consecutive Roe transmissions (see configuration parameter `DcmDspRoeInterMessageTime`)] ()

7.4.4.8.8 ResponseOnEvent in multiple client environments

[SWS_Dcm_00929] [If at least one RoeEvent is in 'ROE started' state the `Dcm` shall always process `ROE` request with the sub-function `clearResponseOnEvent` independent of the `DcmDslProtocol` where the request is received.] ()

[SWS_Dcm_00930] [If at least one RoeEvent is in 'ROE started' state the `Dcm` shall always process `ROE` request with the sub-function `stopResponseOnEvent` independent of the `DcmDslProtocol` where the request is received.] ()

[SWS_Dcm_00940] [If at least one RoeEvent is in 'ROE started' state the `Dcm` shall reject all `ROE` request received on a different `DcmDslProtocol` than the protocol where the RoeEvents were started with an `NRC 0x22` (ConditionsNotCorrect), except for [\[SWS_Dcm_00929\]](#) and [\[SWS_Dcm_00930\]](#).] ()

[SWS_Dcm_01045] [Only TYPE2 messages will support parallel execution of Diagnosis response.] ()

7.4.4.9 Support of segmented response (paged-buffer)

[SWS_Dcm_00028] [If enabled (`DcmPagedBufferEnabled=TRUE`), the `Dcm` module shall provide a mechanism to send responses larger than the configured and allocated diagnostic buffer.] ()

[SWS_Dcm_CONSTR_6055] Dependency for `DcmDslProtocolMaximumResponseSize` [The `DcmDslProtocolMaximumResponseSize` shall be only present if `DcmPagedBufferEnabled` is set to TRUE.]()

[SWS_Dcm_01058] [If `DcmPagedBufferEnabled` == TRUE and the generated Response for a Request is longer than `DcmDslProtocolMaximumResponseSize`, the `Dcm` shall respond with `NRC 0x14 (DCM_E_RESPONSETOOLONG)`.]()

[SWS_Dcm_01059] [If `DcmPagedBufferEnabled` == FALSE and the generated Response for a Request is longer than `Dcm_MsgContextType` structure element `resMaxDataLen`, the `Dcm` shall respond with `NRC 0x14 (DCM_E_RESPONSETOOLONG)`.]()

With paged-buffer handling the ECU is not forced to provide a buffer, which is as large as the maximum length of response. Please note:

- paged-buffer handling is for transmit only - no support for reception.
- paged-buffer handling is not available for the Application (DCM-internal use only).

[SWS_Dcm_01186] [The `Dcm` shall provide the correct amount of Data requested by the `TP` or return `BUFREQ_E_BUSY` in case the requested amount of data is not available.] (*RS_Diag_04147*)

Note: In case the requested amount of data is not available, the `Dcm` should fill up the paged buffer immediately.

7.4.4.10 Support of ResponsePending response triggered by the Application

In some cases, e.g. in case of routine execution, the Application needs to request an immediate `NRC 0x78` (Response pending), which shall be sent immediately and not just before reaching the response time (`P2ServerMax` respectively `P2*ServerMax`).

When the `Dcm` module calls an operation and gets an error status `DCM_E_FORCE_RCRRP`, the `DSL` submodule will trigger the transmission of a negative response with `NRC 0x78` (Response pending). This response needs to be sent from a separate buffer, in order to avoid overwriting the ongoing processing of the request.

7.4.4.11 Manage security level

[SWS_Dcm_00020] [The `DSL` submodule shall save the level of the current active security level.] (*RS_Diag_04005*)

For accessing this level, the `DSL` submodule provides interfaces to:

- get the current active security level: `Dcm_GetSecurityLevel`
- set a new security level: `DsllInternal_SetSecurityLevel()`

[SWS_Dcm_00033] [During `Dcm` initialization the security level is set to the value 0x00 (DCM_SEC_LEV_LOCKED).] (*SRS_BSW_00101, RS_Diag_04005*)

[SWS_Dcm_00139] [The `DSL` shall reset the security level to the value 0x00 (i.e. the security is enabled) under one of the following conditions: - if a transition from any diagnostic session other than the `defaultSession` to another session other than the `defaultSession` (including the currently active diagnostic session) is performed or - if a transition from any diagnostic session other than the `defaultSession` to the `defaultSession` (`DsInternal_SetSecurityLevel()` (initiated by `UDS` Service `DiagnosticSessionControl` (0x10) or `S3Server` timeout) is performed.) ()

Only one security level can be active at a time.

[SWS_Dcm_01329] [On every security level change the `Dcm` shall update the `Mod-eDeclarationGroup` `DcmSecurityAccess` with the new security level.] ()

[SWS_Dcm_CONSTR_6083] Dependency on `DcmDspSecurityAttemptCounterEnabled` [If `DcmDspSecurityNumAttDelay` is not configured, the `DcmDspSecurityAttemptCounterEnabled` on the same `DcmDspSecurityRow` shall be set to FALSE.] (*RS_Diag_04005*)

7.4.4.11.1 Initialization sequence

[SWS_Dcm_01154] [At initialization, for each `DcmDspSecurityRow` entry for which the `DcmDspSecurityAttemptCounterEnabled` configuration parameter is set to TRUE, the corresponding `Xxx_GetSecurityAttemptCounter` shall be called in order to get the value of the `AttemptCounter` for each of these `DcmDspSecurityRow` entries.] ()

[SWS_Dcm_01156] [If `Xxx_GetSecurityAttemptCounter` has returned `E_NOT_OK` the attempt counter shall be set to the value configured in `DcmDspSecurityNumAttDelay` of the according `SecurityLevel`.] ()

[SWS_Dcm_01351] [If any `Xxx_GetSecurityAttemptCounter` operation returns a `DCM_E_PENDING` value, the `Dcm` shall interrupt calling the `Xxx_GetSecurityAttemptCounter()` in order to resume this chain of calls within the next `Dcm_MainFunction()` cycle.] ()

Note: this may be the case when these values are stored within some specific non-volatile memory.

[SWS_Dcm_CONSTR_6076] Dependency for `DcmDspSecurityGetAttemptCounterFnc` [`DcmDspSecurityGetAttemptCounterFnc` shall be present only if `DcmDspSecurityUsePort` is set to `USE_ASYNC_FNC` and `DcmDspSecurityAttemptCounterEnabled` is set to TRUE.] ()

[SWS_Dcm_01352] [If the delay after the first call of the `Dcm_MainFunction()` which is configured in `DcmDspSecurityMaxAttemptCounterReadoutTime` has been reached and all the `Xxx_GetSecurityAttemptCounter` have not been called

yet (i.e. one operation has returned a DCM_E_PENDING status in the previous `Dcm_MainFunction()` cycle), the pending operation shall be cancelled by a call with the `OpStatus` set to `DCM_CANCEL`.]()

[SWS_Dcm_01353] [In the conditions of **[SWS_Dcm_01352]**, the AttemptCounters of remaining security levels (which have not been obtained via the calls to their `Xxx_GetSecurityAttemptCounter`) shall be initialized with the value configured in `DcmDspSecurityNumAttDelay` of the according `SecurityLevel`.]()

[SWS_Dcm_01354] [While not all `Xxx_GetSecurityAttemptCounter` operations have returned a final status and the operation chain has not been cancelled, the `conditionsNotCorrect` (0x22) NRC shall be returned to any `SecurityAccess` (0x27) request-Seed subfunction request.]()

[SWS_Dcm_01355] [Once all the AttemptCounter values have been successfully or unsuccessfully retrieved (all the `Xxx_GetSecurityAttemptCounter()` operations have been executed and have returned a final, non-PENDING error value or the operation chain has been cancelled), if at least one of the restored AttemptCounter values is greater than or equal to the `DcmDspSecurityNumAttDelay` configured for its corresponding `DcmDspSecurityRow`, the `Dcm` shall start the `SecurityDelayTimer` with the higher value of `DcmDspSecurityDelayTimeOnBoot` / `DcmDspSecurityDelayTime` of the according `DcmDspSecurityRow`.]()

[SWS_Dcm_01356] [A timer (`DcmDspSecurityDelayTime`, `DcmDspSecurityMaxAttemptCounterReadoutTime`) which is configured with 0 shall be considered to have timed out instantaneously when it is started, i.e. shall have no delay effect.]()

[SWS_Dcm_CONSTR_6074] Dependency for `DcmDspSecurityMaxAttemptCounterReadoutTime` [`DcmDspSecurityMaxAttemptCounterReadoutTime` shall be a multiple and at minimum equal to `DcmTaskTime`.]()

7.4.4.11.2 AttemptCounter update

[SWS_Dcm_01357] [A successful `sendKey` subfunction request or an expired `SecurityDelayTimer` shall reset that security level's specific AttemptCounter.]()

[SWS_Dcm_01155] [The `Dcm` shall call `Xxx_SetSecurityAttemptCounter()` (in case the configuration parameter `DcmDspSecurityAttemptCounterEnabled` for the according `DcmDspSecurityRow` is set to TRUE) when the `Dcm` has changed the attempt counter to inform the application about the counter change.]()

[SWS_Dcm_CONSTR_6078] Dependency for `DcmDspSecuritySetAttemptCounterFnc` [`DcmDspSecuritySetAttemptCounterFnc` shall be present only if `DcmDspSecurityUsePort` is set to `USE_ASYNC_FNC` and the `DcmDspSecurityAttemptCounterEnabled` set to TRUE.]()

7.4.4.12 Manage session state

[SWS_Dcm_00022] [The [DSL](#) submodule shall save the state of the current active session.] ([RS_Diag_04006](#))

For accessing this variable, the [DSL](#) submodule provides interfaces to:

- get the current active session: [Dcm_GetSesCtrlType](#)
- set a new session: [DslInternal_SetSesCtrlType\(\)](#)

[SWS_Dcm_00034] [During [Dcm](#) initialization, the session state is set to the value 0x01 ("DefaultSession").] ([SRS_BSW_00101](#))

[SWS_Dcm_01062] [The call to [Dcm_ResetToDefaultSession](#) allows the application to reset the current session to Default session and invokes the mode switch of the ModeDeclarationGroupPrototype [DcmDiagnosticSessionControl](#) by calling [SchM_Switch_<bsnp>_DcmDiagnosticSessionControl\(RTE_MODE_DcmDiagnosticSessionControl_DCM_DEFAULT_SESSION\).\(\)](#)]

Example: Automatic termination of an extended diagnostic session upon exceeding of a speed limit.

7.4.4.13 Manage authentication state

The [Dcm](#) provides means for authenticated diagnostics. The [DSL](#) sub-module provides an authentication state per diagnostic connection. It initializes this state upon startup and takes care about fallback into non-authenticated states if the connection is idle for some time.

[SWS_Dcm_01477] Authentication state per connection [The [Dcm](#) shall provide an authentication state per configured [DcmDslConnection](#).] ([RS_Diag_04230](#))

[SWS_Dcm_01478] Mode declaration group per authentication state [The [Dcm](#) shall provide the state of each authentication state via the ModeDeclarationGroupPrototype [DcmAuthentication_<ConnectionName>](#).] ([RS_Diag_04230](#))

The [Dcm](#) maintains an authentication state and mirrors this state to the mode declaration group [DcmAuthentication_<ConnectionName>](#). This mode declaration group is intended to be changed only by the [Dcm](#), however applications changing this state have no influence on the [Dcm](#) authentication state.

[SWS_Dcm_01479] Authentication states [The [Dcm](#) shall support per connection the two authentication states:] ([RS_Diag_04230](#))

- deauthenticated
- authenticated

Upon startup, the Dcm is in deauthenticated state or restores the persisted state. A transition to authenticated state can only be done after the client successfully executed the authentication sequence. In some use cases as in production, a frequent power-on/power off sequence is performed. To keep the achieved authentication state over the power off, there is a dedicated mode rule requesting the Dcm to persist the authenticated state.

[SWS_Dcm_01480] Initialization of authentication state [If `DcmDspAuthenticationPersistStateModeRuleRef` is not configured or the mode rule referenced by `DcmDspAuthenticationPersistStateModeRuleRef` is evaluated to false, the Dcm shall initialize within `Dcm_Init` all authentication states to deauthenticated state.] ([\(RS_Diag_04230\)](#))

[SWS_Dcm_01481] Initialization of persisted authentication states [If the mode rule referenced by `DcmDspAuthenticationPersistStateModeRuleRef` is evaluated to true, the Dcm shall initialize the persisted authentication state including role and white list on each connection.] ([\(RS_Diag_04230\)](#))

Transitions between authenticated states are controlled by both DSL and DSP sub-modules. The DSL sub-module is in charge for fallback of authenticated state into deauthenticated state. The DSP sub-module is in charge for transition changes triggered from a client by diagnostic services.

Figure 7.5: Authenticated state transitions without persistent states

[SWS_Dcm_01482] Fallback to deauthenticated session on idle connection [The Dcm shall make a transition from authenticated into deauthenticated state for a configured connection if the following conditions apply:

- The Dcm was in default session when the last diagnostic response was send on that connection and

- `DcmDspAuthenticationDefaultSessionTimeOut` is configured and no valid diagnostic request was received on that connection for `DcmDspAuthenticationDefaultSessionTimeOut` seconds after the last `Dcm_TpTxConfirmation` on that connection.

]([RS_Diag_04230](#))

[SWS_Dcm_01483] Fallback to deauthenticated session on S3server timeout [If the Dcm is in a non-default session and a S3server timeout occurs, the Dcm shall perform a transition from authenticated into deauthenticated state on the authentication state assigned to that connection which was in a non-default session.]([RS_Diag_04230](#))

[SWS_Dcm_01484] Clearing persisted authentication state [If the authentication state of a connection performs a transition to deauthenticated state, the Dcm shall clear all persisted authentication information on that connection.]([RS_Diag_04230](#))

[SWS_Dcm_01485] Reaction of fallback into deauthenticated state [Upon a transition from authenticated into deauthenticated state, the Dcm shall discard the current role, white list and use the configured deauthentication role from `DcmDspAuthenticationDeauthenticatedRole`.] ([RS_Diag_04230](#))

In some use cases, it is desirable that the application set the role instead of using a diagnostic service with its potentially time-consuming certificate parsing. The Dcm provides the API `Dcm_SetDeauthenticatedRole` to overwrite the configured deauthentication role. The overwritten role is only valid in deauthenticated state will not be persisted and is overwritten by a role provided by certificates via service 0x29.

[SWS_Dcm_01486] Default authentication role set from SWC [If a connection is in deauthenticated state and the API `Dcm_SetDeauthenticatedRole` is called, the Dcm shall use the provided deauthenticatedRole as new role per deauthenticated state for this connection.]([RS_Diag_04230](#))

[SWS_Dcm_01487] Setting deauthenticated role by SWC only in deauthenticated state [The Dcm shall process a call of `Dcm_SetDeauthenticatedRole` only if the connection is in deauthenticated state.]([RS_Diag_04230](#))

[SWS_Dcm_01488] Lifetime of deauthenticated role by SWC [A deauthenticated role set by `Dcm_SetDeauthenticatedRole` is discarded when that connection performs a transition authenticated state.] ([RS_Diag_04230](#))

[SWS_Dcm_01489] No persistency for deauthenticated roles by SWC [At startup the ECU shall always use the deauthentication state configured in `DcmDspAuthenticationDeauthenticatedRole`.] ([RS_Diag_04230](#))

7.4.4.14 Keep track of active non-default sessions

[SWS_Dcm_00140] [Whenever a non-default session is active and when the session timeout (S3Server) is reached without receiving any diagnostic request, the `DSL`

submodule shall reset to the default session state ("DefaultSession", 0x01) and invoke the mode switch of the ModeDeclarationGroupPrototype DcmDiagnosticSessionControl by calling SchM_Switch_<bsnp>_DcmDiagnosticSessionControl(RTE_MODE_DcmDiagnosticSessionControl_DEFAULT_SESSION) .]()

Note: <bsnp> is the BSW Scheduler Name Prefix

The start / stop of S3Server timeout timer is processed as follows:

[SWS_Dcm_00141] [

Subsequent start:

- Completion of any final response message or an error indication ([Dcm_TpTx-Confirmation](#): confirmation of complete [PDU](#) or indication of an error)
- Completion of the requested action in case no response message (positive and negative) is required / allowed.
- Indicates an error during the reception of a multi-frame request message. ([Dcm_TpRxIndication](#): indication of an error)

Subsequent stop:

- Start of a multi-frame request message ([Dcm_StartOfReception](#): indicates start of [PDU](#) reception)
- Reception of single-frame request message. ([Dcm_StartOfReception](#): indicates start of [PDU](#) reception)

"Start of S3Server" means reset the timer and start counting from the beginning.] ([RS_Diag_04249](#))

7.4.4.15 Allow to modify timings

[SWS_Dcm_00027] [The [Dcm](#) module shall handle the following protocol timing parameters in compliance with ISO14229-2 [10]: P2ServerMin, P2ServerMax, P2*ServerMin, P2*ServerMax, S3Server] ([RS_Diag_04015](#), [RS_Diag_04249](#))

[SWS_Dcm_00143] [P2min / P2*min and S3Server shall be set to defined values: P2min = 0ms, P2*min = 0ms, S3Server = 5s.] ([RS_Diag_04015](#), [RS_Diag_04249](#))

These protocol timing parameters have influence on the session layer timing (no influence on Transport Layer timing). Some of these timing parameters can be modified while protocol is active with the following means:

- [UDS](#) Service DiagnosticSessionControl (0x10)
- [UDS](#) Service AccessTimingParameter (0x83)

The [DSL](#) submodule provides the following functionalities to modify the timing parameters:

- Provide the active timing parameters,
- Set the new timing parameters. Activation of new timing values is only allowed after sending the response.

7.4.4.16 Handling of different diagnostic protocols

It is necessary to distinguish between different diagnostic protocols (e.g. [OBD](#), enhanced diagnosis ...).

[SWS_Dcm_01365] [If the API [Dcm_GetActiveProtocol](#) is called, the [Dcm](#) shall return the active [UDS](#) protocol as [Dcm_ProtocolType](#) in the [ActiveProtocol](#) parameter.] ([RS_Diag_04163](#))

[SWS_Dcm_01366] [If only an [OBD](#) protocol or no protocol is started and the API [Dcm_GetActiveProtocol](#) is called, the [Dcm](#) shall return with [ActiveProtocol](#) parameter set to [DCM_NO_ACTIVE_PROTOCOL](#).] ([RS_Diag_04163](#))

Note: The [Dcm_GetActiveProtocol](#) API doesn't supply information about running [OBD](#) protocols.

7.4.4.16.1 Different service tables

For the different protocols a different set of allowed diagnostic services is valid (e.g. the [UDS](#) commands for the enhanced diagnosis, the [OBD](#) mode services for the [OBD](#) protocol). It is possible to create different service tables and link them to the diagnostic protocol.

[SWS_Dcm_00035] [With every protocol initialization, the [DSL](#) submodule sets a link to the corresponding service table (see configuration parameter [DcmDslProtocolSIDTable](#)).] ([SRS_BSW_00101](#))

The [DSD](#) submodule uses this link for further processing of diagnostic requests.

7.4.4.16.2 Prioritization of protocol

The configuration parameter [DcmDslProtocolPriority](#) makes it possible to give each protocol its own relative priority. Possible use case: There are ECUs, communicating with a vehicle-internal diagnostic tester (running on enhanced diagnosis) and a vehicle-external [OBD](#) tester. The [OBD](#) communication must have a higher priority than the enhanced diagnosis.

[SWS_Dcm_00015] [A protocol with higher priority is allowed to preempt the already running protocol.] ([RS_Diag_04021](#))

Differentiation of diagnostic protocols is possible, because of different `DcmDslProtocolRxPduId` values (configured per protocol, see configuration parameter `DcmDslProtocolRxPduRef`) referenced in the protocol configuration.

7.4.4.16.3 Preemption of protocol

[SWS_Dcm_00459] [If a running diagnostic request is preempted by a higher priority request (of another protocol), the `DSL` submodule shall call all configured `Xxx_StopProtocol()` functions (see configuration parameter `DcmDslCallbackDCMRequestService`).]()

[SWS_Dcm_01144] [Protocol preemption can't be activated with a `ConcurrentTesterPresent` of a higher priority protocol (see also [SWS_Dcm_01146]).]()

[SWS_Dcm_00079] [In order to cancel pending transmission in lower-layer, related to the lower priority request, the `Dcm` module shall call `PduR_DcmCancelTransmit()` with the following parameters: `Pduld`: the id of the Pdu to be canceled]()

[SWS_Dcm_00460] [When `PduR_DcmCancelTransmit()` returns `E_NOT_OK`, the `Dcm` module shall assume that the ongoing transmission cannot be cancelled and shall not retry to cancel the transmit request. The current protocol shall be stopped and the new one started.]()

[SWS_Dcm_01046] [If a running diagnostic request is preempted by a higher priority request (of another protocol), the `Dcm` shall cancel all external pending operations with `Dcm_OpStatus` set to `DCM_CANCEL`.]()

[SWS_Dcm_01047] [In case an operation to the `Dem` is pending and the new request also requires an interaction with the `Dem`, the `Dcm` shall accept the new request and call the corresponding `Dem API` with the parameters from the new request.]()

[SWS_Dcm_00575] [In order to cancel pending reception in lower-layer, related to the lower priority request, the `Dcm` module shall call `PduR_DcmCancelReceive()` with the following parameters: `Pduld`: the id of the Pdu to be canceled]()

[SWS_Dcm_00576] [When `PduR_DcmCancelReceive()` returns `E_NOT_OK`, the `Dcm` module shall assume that the ongoing reception cannot be cancelled and shall not retry to cancel the receiver request. The current protocol shall be stopped and the new one started.]()

[SWS_Dcm_00625] [A Low-priority or same-priority request can preempt a higher priority protocol if this higher priority protocol is in default session and no active request is in execution phase. In this case the `DSL` submodule shall call all configured `Xxx_StopProtocol()` functions (see configuration parameter `DcmDslCallbackDCMRequestService`).]()

[SWS_Dcm_00728] [The handling of protocols with equal priority shall be possible.]()

[SWS_Dcm_00727] [If a diagnostic request is already running and a second request (ClientB) can not be processed (e.g. due to priority assessment), the response behaviour depends on the configuration option parameter [DcmDslDiagRespOnSecondDeclinedRequest](#) (see [\[SWS_Dcm_00914\]_Conf](#)). If this configuration parameter is TRUE, a negative response with [NRC 0x21](#) (BusyRepeatRequest) shall be issued for the second request (see [\[SWS_Dcm_00788\]](#) and [\[SWS_Dcm_00789\]](#)). If the configuration parameter is FALSE, no response shall be issued (see [\[SWS_Dcm_00790\]](#)).]()

[SWS_Dcm_00729] [In case of multiple clients with different RxPdulIDs which are requesting the same protocol, as all the connections of the same protocol are having the same priority, a second request (with the different RxPduld) will not be processed. If the configuration parameter [DcmDslDiagRespOnSecondDeclinedRequest](#) is TRUE, a negative response with [NRC 0x21](#) (BusyRepeatRequest) shall be issued for the second request. If the configuration parameter is FALSE, no response shall be issued.]()

Note:

- A multitude of RxPdulIDs may be configured per [DcmDslProtocol](#)
- These RxPdulIDs may be themselves connected to different Testers via the PduR configuration
- This means that many Testers may be configured for the same Protocol
- And this represents a non-UDS extension/use case. In order to have a UDS-compliant flow, there should be one [DcmDslProtocol](#) instance per Tester.

[SWS_Dcm_01050] [In case of diagnostic parallel requests, with same / lower priority than the active request then the ComM APIs (ComM_DCM_ActiveDiagnostic, ComM_DCM_InactiveDiagnostic) shall not be called.]()

7.4.4.16.4 Parallel OBD and UDS protocol processing

[SWS_Dcm_01367] [The [Dcm](#) shall process incoming [OBD](#) requests in parallel to a running [UDS](#) request. In this case the protocol priority check according to [\[SWS_Dcm_00015\]](#) is skipped and no protocol pre-emption is done.]([RS_Diag_04163](#))

With the container [DcmDslProtocolRow](#), the [Dcm](#) configuration supports multiple protocols. Each protocol has a configured [DcmDemClientRef](#) defining the [Dem](#) client interacting with the [Dem](#). This client Id allows the [Dem](#) to distinguish between concurrent calls of the [Dcm](#) of the same function or set of functions to process a certain request.

[SWS_Dcm_01369] [While processing a diagnostic request received from a given protocol, the [Dcm](#) shall determine the [DcmDemClientRef](#) of the [DcmDslProtocolRow](#) of the processed protocol. The [Dcm](#) shall use this value in all [Dem](#) API calls that have a ClientId as parameter.]([RS_Diag_04162](#))

[SWS_Dcm_01370] [The [Dcm](#) shall internally serialise all asynchronous C/S interface calls by the same port interface between the [OBD](#) and [UDS](#) protocol processors and return a pending to the re-entrant caller.] ([RS_Diag_04162](#))

[SWS_Dcm_01371] [If the [Dcm](#) received an [OBD](#) request and the [Dcm](#) is processing a diagnostic service in a non-default session, the [Dcm](#) shall cancel the running [UDS](#) request, make a transition into default session and process the [OBD](#) request.] ([RS_Diag_04162](#))

[SWS_Dcm_01372] [If the [Dcm](#) processes an [OBD](#) request and the [Dcm](#) is receiving an [UDS](#) diagnostic request to change in a non-default session, the [Dcm](#) shall delay the [UDS](#) request until the [OBD](#) service is finished according to [\[SWS_Dcm_01371\]](#). After the [OBD](#) service is finished, the [Dcm](#) shall make a transition into the requested non-default session.] ([RS_Diag_04162](#))

7.4.4.16.5 Detection of protocol start

[SWS_Dcm_00036] [With first request of a diagnostic protocol, the [DSL](#) submodule shall call all configured [Xxx_StartProtocol\(\)](#) functions (see configuration parameter [DcmDslCallbackDCMRequestService](#)).] ([SRS_BSW_00101](#))

Inside this function, the Application can examine the environment conditions and enable/disable further processing of the protocol.

[SWS_Dcm_00144] [After all [Xxx_StartProtocol\(\)](#) functions have returned [E_OK](#) (meaning all components have allowed the start of the protocol), the default timing parameters are loaded from the default session configuration (see configuration parameter [DcmDspSessionRow](#)).] ([RS_Diag_04015](#))

[SWS_Dcm_CONSTR_6000] Harmonize the naming between interfaces and modes [The shortname of [DcmDspSessionRow](#) shall match names of [Dcm_SesCtrlType](#) and of the mode declarations of [DcmDiagnosticSessionControl](#). The "DCM_" prefix is mandatory for all shortnames.] ()

[SWS_Dcm_CONSTR_6001] Provide standardized names for ISO standardized diagnostic sessions [The following values of [DcmDspSessionLevel](#) which represent ISO defined diagnostic sessions shall be used for the shortname of [DcmDspSessionRow](#):

- 1 DCM_DEFAULT_SESSION
 - 2 DCM_PROGRAMMING_SESSION
 - 3 DCM_EXTENDED_DIAGNOSTIC_SESSION
 - 4 DCM_SAFETY_SYSTEM_DIAGNOSTIC_SESSION
-] ()

[SWS_Dcm_00145] [After all [Xxx_StartProtocol\(\)](#) functions have returned [E_OK](#) (meaning all components have allowed the start of the protocol), the service table is set (see configuration parameter [DcmDslProtocolSIDTable](#)).] ()

[SWS_Dcm_00146] 「After all Xxx_StartProtocol() functions have returned E_OK (meaning all components have allowed the start of the protocol), the security state is reset.」()

[SWS_Dcm_00147] 「After all Xxx_StartProtocol() functions have returned E_OK (meaning all components have allowed the start of the protocol), the session state is reset to default session. Furthermore the [Dcm](#) module shall invoke the mode switch of the ModeDeclarationGroupPrototype DcmDiagnosticSessionControl by calling SchM_Switch_<bsnp>_DcmDiagnosticSessionControl(RTE_MODE_DcmDiagnosticSessionControl_DEFAULT_SESSION) .」()

Note: <bsnp> is the BSW Scheduler Name Prefix

[SWS_Dcm_00674] 「If Xxx_StartProtocol() doesn't return E_OK, the [Dcm](#) shall return [NRC](#) 0x22.」()

7.4.4.16.6 Protocol stop

A protocol stop can appear only in case of protocol preemption (see chapter [7.4.4.16.3 Preemption of protocol](#)).

[SWS_Dcm_00624] 「With the reception of [Dcm_TpTxConfirmation](#) connected to the response given by the [DSL](#) submodule, the [Dcm](#) shall not stop the current protocol (no call to xxx_StopProtocol).」()

Note: A protocol (e.g. OBD) will be active till reset or other protocol preempts.

[SWS_Dcm_01190] 「If Xxx_StopProtocol() doesn't return E_OK, the [Dcm](#) shall return [NRC](#) 0x22.」()

7.4.4.17 Manage resources

Due to limited resources, the following points should be considered as hints for the design:

- It is allowed to use and allocate only one diagnostic buffer in the [Dcm](#) module. This buffer is then used for processing the diagnostic requests and responses.
- Output of [NRC](#) 0x78 (Response pending) responses is done with a separate buffer.
- paged-buffer handling (see [\[SWS_Dcm_00028\]](#)).

7.4.4.18 Communication Mode Handling

Communication Mode Handling is an interface between [Dcm](#) and ComM. The ComM informs the [Dcm](#) about the current communication state of a channel. The [Dcm](#) is calling the ComM about active Diagnostic which shall prevent an Ecu shutdown/sleep.

The status ActiveDiagnostic shows if diagnostic requests shall keep the ECU awake (ActiveDiagnostic =='DCM_COMM_ACTIVE') or if diagnostic requests shall not prevent an Ecu shutdown/sleep (ActiveDiagnostic =='DCM_COMM_NOT_ACTIVE'). Application can change the status ActiveDiagnostic regarding to system conditions.

[SWS_Dcm_CONSTR_6027] [The application will inform the [Dcm](#) by calling [Xxx_SetActiveDiagnostic\(\)](#) about the ActiveDiagnostic status.]()

[SWS_Dcm_01069] [After [Dcm_Init](#), the [Dcm](#) shall set ActiveDiagnostic to 'DCM_COMM_ACTIVE'.]()

[SWS_Dcm_01070] [If [Xxx_SetActiveDiagnostic\(\)](#) is called with 'false' the [Dcm](#) set ActiveDiagnostic to 'DCM_COMM_NOT_ACTIVE'.]()

[SWS_Dcm_01071] [If [Xxx_SetActiveDiagnostic\(\)](#) is called with 'true' the [Dcm](#) set ActiveDiagnostic to 'DCM_COMM_ACTIVE'.]()

[SWS_Dcm_01142] [The [Dcm](#) shall wait the Full Communication mode indication from the ComM (call to [Dcm_ComM_FullComModeEntered](#)) before initiating the transmission of the diagnostic answer. The time to wait should be no longer than the P2ServerMax calculated from the moment the request was received.]()

[SWS_Dcm_01143] [If the [Dcm](#) fails to confirm a response pending transmission (DCM_E_FORCE_RCRRP) due to [\[SWS_Dcm_01142\]](#), the [Dcm](#) shall trigger the [Det](#) error DCM_E_FORCE_RCRRP_IN_SILENT_COMM.]()

Note : On the reception side a silent communication mode can lead to the lost of the request in case of segmented transmission.

7.4.4.18.1 No Communication

The ComM module will indicate the No Communication Mode to the [Dcm](#) module by calling [Dcm_ComM_NoComModeEntered](#). In response, the [Dcm](#) will immediately disable all transmissions (see the definition of [Dcm_ComM_NoComModeEntered](#) for details).

[SWS_Dcm_00148] [[Dcm_ComM_NoComModeEntered](#) shall disable all kinds of transmissions (receive and transmit) of communication. This means that the message reception and also the message transmission shall be off.]()

[SWS_Dcm_00149] [[Dcm_ComM_NoComModeEntered](#) shall disable the ResponseOnEvent transmissions.]()

[SWS_Dcm_00150] *[Dcm_ComM_NoComModeEntered shall disable the periodicId transmissions (ReadDataByPeriodicIdentifier).]()*

[SWS_Dcm_00151] *[Dcm_ComM_NoComModeEntered shall disable normal transmissions.]()*

[SWS_Dcm_00152] *[After Dcm_ComM_NoComModeEntered has been called, the Dcm module shall not call the function PduR_DcmTransmit().]()*

[SWS_Dcm_01324] *[In case Dcm_ComM_NoComModeEntered is called with a NetworkId for a ComM channel not referenced within the Dcm (see configuration parameter DcmDslProtocolComMChannelRef), the Dcm shall return without performing any further action.]()*

7.4.4.18.2 Silent Communication

The ComM module will indicate the Silent Communication Mode to the Dcm module by calling Dcm_ComM_SilentComModeEntered. In response, the Dcm will immediately disable all transmissions (see the definition of Dcm_ComM_SilentComModeEntered for details).

[SWS_Dcm_00153] *[Dcm_ComM_SilentComModeEntered shall disable all transmission. This means that the message transmission shall be off.]()*

[SWS_Dcm_00154] *[Dcm_ComM_SilentComModeEntered shall disable the ResponseOnEvent transmissions.]()*

[SWS_Dcm_00155] *[Dcm_ComM_SilentComModeEntered shall disable the periodicId transmissions (ReadDataByPeriodicIdentifier) shall be disabled.]()*

[SWS_Dcm_00156] *[Dcm_ComM_SilentComModeEntered shall disable the normal transmissions.]()*

[SWS_Dcm_01325] *[In case Dcm_ComM_SilentComModeEntered is called with a NetworkId for a ComM channel not referenced within the Dcm (see configuration parameter DcmDslProtocolComMChannelRef), the Dcm shall return without performing any further action.]()*

7.4.4.18.3 Full Communication

The ComM module will indicate the Full Communication Mode to the Dcm module by calling Dcm_ComM_FullComModeEntered. In response, the Dcm will enable all transmissions (see the definition of Dcm_ComM_FullComModeEntered for details).

[SWS_Dcm_00157] *[Dcm_ComM_FullComModeEntered shall enable all kind of communication. This means that the message reception and also the message transmission shall be on.]()*

[SWS_Dcm_00159] [[Dcm_ComM_FullComModeEntered](#) shall enable the ResponseOnEvent transmissions.]()

[SWS_Dcm_00160] [[Dcm_ComM_FullComModeEntered](#) shall enable the periodicId transmissions (ReadDataByPeriodicIdentifier).]()

[SWS_Dcm_00161] [[Dcm_ComM_FullComModeEntered](#) shall enable the normal transmissions.]()

[SWS_Dcm_00162] [After [Dcm_ComM_FullComModeEntered](#) has been called, the [Dcm](#) shall handle the functions [Ds1Internal_ResponseOnOneDataByPeriodicId\(\)](#) or [Ds1Internal_ResponseOnOneEvent\(\)](#) without restrictions.]()

[SWS_Dcm_01326] [In case [Dcm_ComM_FullComModeEntered](#) is called with a NetworkId for a ComM channel not referenced within the [Dcm](#) (see configuration parameter [DcmDslProtocolComMChannelRef](#)), the [Dcm](#) shall return without performing any further action.]()

7.4.4.18.4 Diagnostic Activation State

The [Dcm](#) notifies the ComM module about the internal diagnostic state for all networks. There are two options for the diagnostic state on a network. In 'active' diagnostic state, the [Dcm](#) is processing one or more diagnostic requests from this network or the [Dcm](#) is in a non-default session. In 'inactive' diagnostic state, the [Dcm](#) is in default session and is not processing a diagnostic request on that network.

When a network has no communication in progress, the [Dcm](#) will set the diagnostic activation state to 'inactive'. When there is a diagnostic communication on a network the [Dcm](#) sets the diagnostic state to 'active'. In any non-default session, the diagnostic state remains in state 'active'. The communication state can also be controlled by the API [Xxx_SetActiveDiagnostic](#) according to [\[SWS_Dcm_01070\]](#) and [\[SWS_Dcm_01071\]](#).

[SWS_Dcm_01373] [The [Dcm](#) shall go into 'active' diagnostic state on a network, if a diagnostic request is received on a network or the diagnostic session is changed to any non-default session.] ([RS_Diag_04006](#))

[SWS_Dcm_01374] [The [Dcm](#) shall go into 'inactive' diagnostic state on a network when the current diagnostic request processing is finished and the [Dcm](#) is not processing a diagnostic request of another protocol on this network and if the [Dcm](#) is in default session.] ([RS_Diag_04006](#))

[SWS_Dcm_01375] [The [Dcm](#) shall go into 'inactive' diagnostic state on all networks if a S3Server timeout occurs and the [Dcm](#) makes a transition into default session.] ([RS_Diag_04006](#))

[SWS_Dcm_01376] [If ActiveDiagnostic is 'DCM_COMM_ACTIVE' and the [Dcm](#) is doing a transition into 'active' diagnostic state of a diagnostic protocol, the [Dcm](#) shall call [ComM_DCM_ActiveDiagnostic\(NetworkId\)](#), with the networkId associated to the received Pdu (see [DcmDslProtocolComMChannelRef](#)), with every request, to inform

the ComM module about the need to stay in Full Communication Mode.] (RS_Diag_04006)

[SWS_Dcm_01377] [Upon a diagnostic state transition into 'inactive', the **Dcm** shall notify the ComM module about an inactive diagnostic state on a network by calling ComM_DCM_InactiveDiagnostic(NetworkId), with the networkId associated to the received Pdu (see **DcmDslProtocolComMChannelRef**).] (RS_Diag_04006)

[SWS_Dcm_01378] [The definition of a finished diagnostic request according to [SWS_Dcm_01374], shall be as follows:

- the **Dcm** has sent a positive or negative response unequal to NRC 0x78 by receiving the **Dcm_TpTxConfirmation** connected to the response given by the **DSL** submodule
- the **Dcm** has processed the service with SPRMIB=true and the positive response was suppressed
- in case of functional addressing, the **Dcm** has processed the service and the negative response was suppressed.

] (RS_Diag_04006)

7.5 Diagnostic Service Dispatcher (DSD)

7.5.1 Introduction

The **DSD** submodule is responsible to check the validity of an incoming diagnostic request (Verification of Diagnostic Session/Security Access levels/Application permission) and keeps track of the progress of a service request execution.

[SWS_Dcm_00178] [The **DSD** submodule shall only process valid requests and shall reject invalid ones.]()

7.5.2 Use cases

The following use cases are relevant and are described in detail in the following:

- Receive a request message and transmit a positive response message
- Receive a request message and suppress a positive response
- Receive a request message and suppress a negative response
- Receive a request message and transmit a negative response message
- Send a positive response message without corresponding request
- Segmented Responses

7.5.2.1 Receive a request message and transmit a positive response message

This is the standard use case of normal communication ("ping-pong"). The server receives a diagnostic request message. The [DSD](#) submodule ensures the validity of the request message. In this use case, the request is valid and the response will be positive. The request will be forwarded to the appropriate data processor in the [DSP](#) submodule. When the data processor has finished all actions of data processing, it triggers the transmission of the response message by the [DSD](#) submodule.

If the data processor processes the service immediately as part of the request indication function, the data processor can trigger the transmission inside this indication function ("synchronous"). If the processing takes a longer time (e. g. waiting on EEPROM driver), the data processor defers some processing ("asynchronous"). The response pending mechanism is covered by the [DSL](#) submodule. The data processor triggers the transmission explicitly, but from within the data processor's context.

As soon as a request message is received, the corresponding DcmPduld is blocked by the [DSL](#) submodule (see [\[SWS_Dcm_00241\]](#)). During the processing of this request, no other request of the same protocol type (e.g. an enhanced session can be ended by a [OBD](#) session) can be received, until the corresponding response message is sent and the DcmPduld is released again.

7.5.2.2 Receive a request message and suppress a positive response

This is a sub-use-case of the previous one. Within the [UDS](#) protocol it is possible to suppress the positive response by setting a special bit in the request message (see [\[SWS_Dcm_00200\]](#)). This special suppression handling is completely performed within the [DSD](#) submodule.

7.5.2.3 Receive a request message and suppress a negative response

In case of functional addressing the [DSD](#) submodule shall suppress the negative response for [NRC](#) 0x11, 0x12, 0x31, 0x7E and 0x7F (see [\[SWS_Dcm_00001\]](#)).

7.5.2.4 Receive a request message and transmit a negative response message

There are many different reasons why a request message is rejected and a negative response is to be sent. If a diagnostic request is not valid or if a request may not be executed in the current session, the [DSD](#) submodule will reject the processing and a negative response will be returned.

But there are even many reasons to reject the execution of a well-formed request message, e.g. if the ECU or system state does not allow the execution. In this case, the

DSP submodule will trigger a negative response including an **NRC** supplying additional information why this request was rejected.

In case of a request composed of several parameters (e.g. a **UDS** Service Read-DataByIdentifier (0x22) request with more than one identifier to read), each parameter is treated separately. And each of these parameters can return an error. This kind of request returns a positive response if at least one of the parameters was processed successfully.

[SWS_Dcm_00827] [The **DSD** sub-module shall check the received diagnostic request in the order given by ISO14229-1 [1]. If one of the computations failed the **Dcm** shall stop the execution of the **NRC** check sequence then stop or do not start the execution of the received diagnostic request and finally transmit the **NRC** for which the computation failed.]()

7.5.2.5 Send a positive response message without corresponding request

There are two services within the **UDS** protocol, where multiple responses are sent for only one request. In general, one service is used to enable (and disable) an event- or time-triggered transmission of another service, which again is sent by the ECU without a corresponding request (see ISO14229-1 [1]). These services are:

- **UDS** Service ReadDataByPeriodicIdentifier (0x2A). This service allows the client to request the periodic transmission of data record values from the server identified by one or more periodicDataIdentifiers.

Type 2 = UUDT message on a separate DcmTxPduld.

- ResponseOnEvent (0x86). This service requests a server to start or stop transmission of responses on a specified event.

Type 1 = USDT messages on the DcmTxPduld already used for normal diagnostic responses,

Type 2 = USDT messages on separate DcmTxPduld.

For Type 1, the outgoing messages must be synchronized with "normal outgoing messages", which have a higher priority.

This handling is especially controlled by the **DSL** submodule. However, the **DSD** submodule also provides the possibility to generate a response without a corresponding request.

7.5.2.6 Segmented Responses (paged-buffer)

Within the diagnostic protocol, some services allow to exchange a significant amount of data, e.g. [UDS](#) Service ReadDTCInformation (0x19) and [UDS](#) Service TransferData (0x36).

In the conventional approach, the ECU internal buffer must be large enough to keep the longest data message which is to be exchanged (worst-case) and the complete buffer is filled before the transmission is started.

RAM memory in an ECU often is a critical resource, especially in smaller micros. In a more memory-saving approach, the buffer is filled only partly, transmitted partly and then refilled partly - and so on. This paging mechanism requires only a significantly reduced amount of memory, but demands a well-defined reaction time for buffer refilling.

The user can decide whether to use the "linear buffer" or paged-buffer for diagnostics.

7.5.3 Interaction of the [DSD](#) with other modules

The [DSD](#) submodule is called by the [DSL](#) submodule when receiving a diagnostic message and performs the following operations:

- delegates processing of request to the [DSP](#) submodule or external modules outside the [Dcm](#)
- keeps track of request processing (Return the status on `<Module>_<DiagnosticService>()` and `<Module>_<DiagnosticService>_<SubService>()` APIs call or "Service Interpreter calls")
- transmits the response of the Application to the [DSL](#) submodule (Transmit functionality)

7.5.3.1 Interaction of the [DSD](#) with the [DSL](#) main functionality

Direction	Explanation
Bidirectional	Exchange of the Diagnostic Messages (receive/transmit).
DSD submodule to DSL submodule	Obtain latest diagnostic session and latest security level.
DSL submodule to DSD submodule	Confirmation of transmission of Diagnostic Message.

Table 7.3: Interaction between the [DSD](#) submodule and the [DSL](#) submodule

7.5.3.2 Interaction of the [DSD](#) with the [DSP](#)

Direction	Explanation
DSD submodule to DSP submodule	- Delegate processing of request. - Confirmation of transmission of Diagnostic Message.
DSP submodule to DSD submodule	- Signal that processing is finished.

Table 7.4: Interaction of the DSD with the DSP

7.5.4 Functional Description of the DSD

7.5.4.1 Support checking the diagnostic service identifier and adapting the diagnostic message

The DSD submodule shall be triggered by the DSL submodule if a new diagnostic message is recognized. The DSD submodule will start processing by analyzing the diagnostic service identifier contained in the received diagnostic message.

[SWS_Dcm_00084] [If configured (configuration parameter `DcmRespondAllRequest`=FALSE), if the Dcm module receives a diagnostic request that contains a service ID that is in the range from 0x40 to 0x7F or in the range from 0xC0 to 0xFF, the Dcm shall not respond to such a request.]()

This range corresponds to the diagnostic response identifier.

[SWS_Dcm_00192] [The DSD submodule shall analyze the (incoming) diagnostic message for the diagnostic service identifier (based on first byte of the diagnostic message) and shall check the supported services with the newly received diagnostic service identifier.]()

[SWS_Dcm_00193] [During this check, the DSD submodule shall search the newly received diagnostic service identifier in the "Service Identifier Table".]()

For performance reasons it might be necessary that the support check is done with a "lookup table" functionality. In this "Service Identifier Table" all supported Service IDs of the ECU are predefined.

[SWS_Dcm_00195] [The DSL submodule shall provide the current "Service Identifier Table"]()

Rationale for **[SWS_Dcm_00195]**: The "Service Identifier Table" and the information about the supported services will be generated out of the configuration. More than one Service Identifier Table can be configured for selection. At one time only one Service Identifier Table can be active.

[SWS_Dcm_00196] [For the check, the DSD submodule shall scan the active "Service Identifier Table" for a newly received diagnostic service identifier. If this service identifier is supported and if the configuration parameter `DcmDsdSidTabFnc` (see ECUC_Dcm_00777) is not empty, the DSD submodule shall call the configured service interface (<Module>_<DiagnosticService>). If the configuration parameter is empty, the Dcm shall call the internally implemented service interface.]()

The diagnostic service identifier is not supported when it is not included in the "Service Identifier Table".

[SWS_Dcm_00197] [If the newly received diagnostic service identifier is not supported, the [DSD](#) submodule shall transmit a negative response with [NRC](#) 0x11 (Service not supported) to the [DSL](#) submodule.]()

[SWS_Dcm_00198] [The [DSD](#) submodule shall store the newly received diagnostic service identifier for later use.]()

For example: `WriteDataByIdentifier` (for writing VIN number):

1. A new diagnostic message is received by the [DSL](#) submodule. (Diagnostic Message `WriteDataByIdentifier` = 0x2E, 0xF1, 0x90, 0x57, 0x30, 0x4C, 0x30, 0x30, 0x30, 0x34, 0x33, 0x4D, 0x42, 0x35, 0x34, 0x31, 0x33, 0x32, 0x36)
2. The [DSL](#) submodule indicates a new diagnostic message with the "Data Indication" functionality to the [DSD](#) submodule. In the diagnostic message buffer the diagnostic message is stored (buffer = 0x2E, 0xF1, 0x90, ...).
3. The [DSD](#) submodule executes a check of the supported services with the determined service identifier (first byte of buffer 0x2E) on the incoming diagnostic message.
4. The incoming diagnostic message is stored in the [Dcm](#) variable `Dcm_MsgContextType`.

[SWS_Dcm_CONSTR_6047] [Id of the Service identifier configured in [DcmDsd-SidTabServiceId](#) shall be unique within one [DcmDsdServiceTable](#).]()

[SWS_Dcm_00732] [For the first call of <Module>_<DiagnosticService> the `opStatus` shall be set to `DCM_INITIAL`.]()

[SWS_Dcm_00733] [The [Dcm](#) shall not accept further requests (on same or lower priority) while <Module>_<DiagnosticService>() returns `DCM_E_PENDING`. Dcm-internal timeout handling (based on RCR-RP limitation) may lead to a cancellation of the external diagnostic service processing.]()

[SWS_Dcm_00735] [In case of cancellation the [API](#) <Module>_<DiagnosticService> is called again with the parameter `opStatus` set to `DCM_CANCEL`.]()

7.5.4.2 Handling of "suppressPosRspMsgIndicationBit"

The "suppressPosRspMsgIndicationBit" is part of the subfunction parameter structure (Bit 7 based on second byte of the diagnostic message, see ISO14229-1 [1] Section 6.5: Server response implementation rules).

[SWS_Dcm_00200] [If the "suppressPosRspMsgIndicationBit" is TRUE, the [DSD](#) submodule shall NOT send a positive response message.]([RS_Diag_04020](#))

[SWS_Dcm_00201] [The [DSD](#) submodule shall remove the "suppressPosRspMsgIndicationBit" (by masking the Bit) from the diagnostic message.]()

[SWS_Dcm_00202] [The [Dcm](#) module shall transport the information on a suppression of a positive response being active (between the layers) via the parameter [Dcm_MsgContextType](#).]()

[SWS_Dcm_00203] [In case of responsePending the [Dcm](#) module shall clear the "suppressPosRspMsgIndicationBit."]()

Rationale for [\[SWS_Dcm_00203\]](#): In the described case the final response (negative/-positive) is required.

[SWS_Dcm_00204] [The [Dcm](#) module shall only perform the "suppressPosRspMsgIndicationBit" handling when the configuration parameter [DcmDsdSidTabSubfuncAvail](#) is set for the newly received service identifier]()

Note: The "suppressPosRspMsgIndicationBit" handling needs to be considered independent of the processing order in the request (like for RoutineControl service).

Rationale for [\[SWS_Dcm_00204\]](#): The "suppressPosRspMsgIndicationBit" is only available if a service has a subfunction.

7.5.4.3 Verification functionality

Prior of execution of a received diagnostic service, the DSD performs a set of verifications. The DSD will only accept a service, if all verifications are successfully passed.

[SWS_Dcm_01535] DSD verifications prior of service execution [The Dcm shall only accept a diagnostic request, if the following verifications have been passed in the following order:]([RS_Diag_04230](#), [RS_Diag_04005](#), [RS_Diag_04006](#))

1. Verification of Manufacturer permission (Call of the manufacturer interface indication operation)
2. Verification of the SID
3. Verification of the service access control on the current authentication state
4. Verification of the Diagnostic Session
5. Verification of the Service Security Access levels
6. Verification of the Supplier permission (Call of the Supplier interface indication operation)
7. Verification of the Mode rules for service IDs.

[SWS_Dcm_01474] [In case the DSD generates a [NRC](#), the Dcm shall only call [XXX_Confirmation](#).] ([RS_Diag_04235](#))

This means that the Dcm will not call [DsplInternal_DcmConfirmation](#)().

7.5.4.3.1 Verification of the diagnostic service access rights

The UDS service Authentication (0x29) is used to change the authentication state of a diagnostic connection and to provide the access rights. Depending on the reached role and provided white list a dynamic set of diagnostic services is available for the tester on that connection. The DSD submodule verifies on service ID (SID) and sub-function (SF) level, if a service can be executed or not.

[SWS_Dcm_01536] Authentication on UDS services only [The Dcm shall only verify the authentication for UDS services. A UDS service has a service ID within the range of 0x10 and 0xFF.] ([RS_Diag_04230](#))

OBD services are explicitly excluded from authentication checks. By legislation the OBD services need to be always available, independent from active authentication state. If WWH-OBD is used the system engineer must ensure that these services are always accessible.

[SWS_Dcm_01537] Verifying access rights [The Dcm shall only verify and check the configured access rights of a diagnostic service, if the container `DcmDspAuthentication` is configured.] ([RS_Diag_04230](#))

If no `DcmDspAuthentication` is configured, the Dcm will process all diagnostic services as if the current connection would grant access to execute the current processed service. Checking the access rights for diagnostic services is done at different levels of the service structure. The use of diagnostic service access rights introduces means to allow or to refuse a diagnostic service due to current roles and authentication states. Some services shall always be allowed to be executed, like the service 0x29 (Authentication) to set the current tester access rights. This service and other OEM or supplier specific services should have granted access independent from the authentication state. To realize this, the Dcm uses a default role that is used in all deauthenticated states. In that state, all role based verifications are done as in authenticated state. The active role is provided by the configuration.

[SWS_Dcm_01538] Access rights for services in deauthenticated state [If the current connection is in deauthenticated state, the Dcm shall use the role configured in `DcmDspAuthenticationDeauthenticatedRole` as current role for all role based access verification checks.] ([RS_Diag_04230](#))

[SWS_Dcm_01539] Definition of allowed service execution [The Dcm shall allow the service execution, if a role verification was successful or the service is allowed by the white list.] ([RS_Diag_04233](#))

[SWS_Dcm_01540] Diagnostic service execution rights verification [The Dcm shall check if a service execution is permitted in the current authentication check or not. The Dcm shall perform the following checks in the given order below. If a check grants access to a service, the remaining checks are skipped:

1. Checks on service ID level
2. Checks on service ID and sub-function level

3. Checks for services with one or multiple DIDs
4. Check on dynamically defined DIDs
5. Checks on service 0x31 per sub-function
6. Checks on service 0x19 parameter MemorySelection

]([RS_Diag_04233](#))

[SWS_Dcm_01541] Service ID authentication check for UDS service requests

Upon processing a diagnostic service, the Dcm shall grant access to the diagnostic service if:

1. a DcmDsdServiceRole is configured for that service and the verification according to [[SWS_Dcm_01522](#)] was successful or
2. the active white list on that connection has one entry for a SID (1-byte element) which matches that service.

]([RS_Diag_04233](#))

[SWS_Dcm_01542] Service with sub-function authentication check for UDS service requests [Upon processing a diagnostic service with sub-function, the Dcm shall grant access to the diagnostic service if:

1. a DcmDsdSubServiceRole is configured for that service and sub-function and the verification according to [[SWS_Dcm_01522](#)] was successful or
2. the active white list on that connection has one entry for a SID with sub-function (2-byte element) that matches that service and sub-function.

]([RS_Diag_04230](#))

[SWS_Dcm_01562] White list verification for services with 3 and 4 bytes [For 3 and 4 bytes white list for services entries, the Dcm shall verify on the full length of the configured white list service element. The service is granted access if the first bytes of the received request match the entire white list entry.] ([RS_Diag_04233](#))

Verification of byte 3 and 4 within the Dsd is beyond the scope of a typical Dsd operation. It provides means to extend the capabilities of white list service verifications and gives means to adapt to legacy authentication solutions.

[SWS_Dcm_01544] Response behavior of services without access rights [If the service execution verification fails due to a failed check in scope of [[SWS_Dcm_01540](#)], the Dcm shall send a NRC 0x34 authenticationRequired and stop the service processing.] ([RS_Diag_04230](#))

7.5.4.3.2 Verification of the Diagnostic Session

The [UDS](#) Service DiagnosticSessionControl (0x10) is used to enable different diagnostic sessions in the ECU (e.g. Default session, Extended session). A diagnostic session

enables a specific set of diagnostic services and/or functionality in the ECU. It furthermore enables a protocol-depending data set of timing parameters applicable to the started session.

On receiving a service request, the [DSD](#) module will obtain the current Diagnostic Session with [Dcm_GetSesCtrlType](#) and will verify whether the execution of the requested service (NOT the [UDS](#) Service DiagnosticSessionControl (0x10)) and sub-service is allowed in the current diagnostic session or not.

Note that the handling of the [UDS](#) Service DiagnosticSessionControl (0x10) itself is not part of the [DSD](#) submodule.

[SWS_Dcm_00211] [If the newly received diagnostic service is not allowed in the current Diagnostic Session (according to the configuration parameter [DcmDsdSidTabSessionLevelRef](#)), the [DSD](#) submodule shall transmit a negative response with [NRC](#) 0x7F (serviceNotSupportedInActiveSession) to the [DSL](#) submodule.]()

[SWS_Dcm_00616] [If the newly received diagnostic service is allowed in the current Diagnostic Session (see [\[SWS_Dcm_00211\]](#)), but the requested subservice is not allowed in the current Diagnostic Session (according to the configuration parameter [DcmDsdSubServiceSessionLevelRef](#)), the [DSD](#) submodule shall transmit a negative response with [NRC](#) 0x7E (subFunctionNotSupportedInActiveSession) to the [DSL](#) submodule.]()

7.5.4.3.3 Verification of the Service Security Access levels

The purpose of the Security Access level handling is to provide a possibility to access data and/or diagnostic services, which have restricted access for security, emissions, or safety reasons. The [DSD](#) submodule shall perform this handling with the [UDS](#) Service SecurityAccess (0x27). The [DSD](#) submodule will perform a verification whether the execution of the requested service (NOT the [UDS](#) Service SecurityAccess (0x27)) is allowed in the current Security level by asking for the current security level, using the [DSL](#) function [Dcm_GetSecurityLevel](#).

The management of the security level is not part of the [DSD](#) submodule.

Note: For some use cases (e.g. [UDS](#) Service ReadDataByIdentifier (0x22), where some DataIdentifier can be secure) it will be necessary for the Application to call also the function [Dcm_GetSecurityLevel](#).

[SWS_Dcm_00217] [If the newly received diagnostic service is not allowed in the current Security level (according to the configuration parameter [DcmDsdSidTabSecurityLevelRef](#)), the [DSD](#) submodule shall transmit a negative response with [NRC](#) 0x33 (Security access denied) to the [DSL](#) submodule.]()

[SWS_Dcm_00617] [If the newly received diagnostic service is allowed in the current Security level (see [\[SWS_Dcm_00217\]](#)), but the requested subservice is not allowed in

the current Security level (according to the configuration parameter [DcmDsdSubServiceSecurityLevelRef](#)), the [DSD](#) submodule shall transmit a negative response with [NRC](#) 0x33 (Security access denied) to the [DSL](#) submodule.]()

7.5.4.3.4 Verification of the Service mode dependencies

[SWS_Dcm_00773] [If the newly received diagnostic service is not allowed in the current mode condition (according to the configuration parameter [DcmDsdSidTabModeRuleRef](#)), the [DSD](#) submodule shall transmit the calculated negative response of the referenced [DcmModeRule](#) to the [DSL](#) submodule.]()

[SWS_Dcm_00774] [If the newly received diagnostic service is allowed in the current mode condition [[SWS_Dcm_00773](#)], but the requested subservice is not allowed in the current mode condition (according to the configuration parameter [DcmDsdSubServiceModeRuleRef](#)), the [DSD](#) submodule shall transmit the calculated negative response of the referenced [DcmModeRule](#) to the [DSL](#) submodule.]()

7.5.4.4 Check format and subfunction support

The [DSD](#) submodule checks whether a specific subfunction is supported before executing the requested command.

[SWS_Dcm_00273] General sub-function supported NRC check [The [DSD](#) shall send the negative response [NRC](#) 0x12 (sub-functionNotSupported), if for the processed service no configured [DcmDsdSubService](#) exists with the [DcmDsdSubServiceId](#) of the processed service. This [NRC](#) check shall not be done for [UDS](#) Service 0x31 (RoutineControl).]()

The [DSD](#) submodule will check for the minimum message length before executing the requested command.

[SWS_Dcm_00696] [The [DSD](#) submodule shall trigger a negative response with [NRC](#) 0x13 (Incorrect message length or invalid format), if the length of the request is inferior to the minimum length of the request.]()

[SWS_Dcm_01411] [If [DcmDsdSubService](#) is configured for a [DcmDsdService](#), the [Dcm](#) shall support the sub-function configured in [DcmDsdSubServiceId](#) with [SPRMIB](#) set to 0 or 1.]()

7.5.4.4.1 Verification of the Manufacturer Application environment/permission

The purpose of this functionality is that, just after receiving the diagnostic request, the Manufacturer Application is requested to check permission/environment.

E.g. in after-run ECU state, it might be not allowed to process [OBD](#) requests.

[SWS_Dcm_00218] [If container `DcmDsdServiceRequestManufacturerNotification` exists, the `DSD` submodule shall call the operation `Xxx_Indication` on all configured ServiceRequestIndication ports (see configuration parameter `DcmDsdServiceRequestManufacturerNotification`).]()

[SWS_Dcm_00462] [If at least a single `Xxx_Indication` function called according to [SWS_Dcm_00218] returns `E_REQUEST_NOT_ACCEPTED`, the `DSD` submodule shall give no response.]()

[SWS_Dcm_01172] [In case of [SWS_Dcm_00462], the `DSD` shall only call `Xxx_Confirmation` but not `DsInternal_DcmConfirmation`.]()

[SWS_Dcm_00463] [If at least a single `Xxx_Indication` function called according to [SWS_Dcm_00218] has returned `E_NOT_OK` and no function has returned `E_REQUEST_NOT_ACCEPTED`, the `DSD` submodule shall trigger a negative response with `NRC` from the ErrorCode parameter.]()

[SWS_Dcm_01321] [If more than one `Xxx_Indication` function called, according to [SWS_Dcm_00218], has returned `E_NOT_OK` and no function has returned `E_REQUEST_NOT_ACCEPTED`, the `DSD` submodule shall trigger a negative response using the ErrorCode parameter from the first `Xxx_Indication` returning `E_NOT_OK`.] (*RS_Diag_04011*)

7.5.4.4.2 Verification of the Supplier Application environment/permission

The purpose of this functionality is that, right before processing the diagnostic message, the Supplier Application is requested to check permission/environment.

E.g. in after-run ECU state, it might be not allowed to process `OBD` requests.

[SWS_Dcm_00516] [If container `DcmDsdServiceRequestSupplierNotification` exists, the `DSD` submodule shall call the operation `Xxx_Indication` on all configured ServiceRequestIndication ports (see configuration parameter `DcmDsdServiceRequestSupplierNotification`).]()

[SWS_Dcm_00517] [If at least a single `Xxx_Indication` function called according to [SWS_Dcm_00516] returns `E_REQUEST_NOT_ACCEPTED`, the `DSD` submodule shall give no response.]()

[SWS_Dcm_00518] [If at least a single `Xxx_Indication` function called according to [SWS_Dcm_00516] has returned `E_NOT_OK` and no function has returned `E_REQUEST_NOT_ACCEPTED`, the `DSD` submodule shall trigger a negative response with `NRC` from the ErrorCode parameter.]()

[SWS_Dcm_01322] [If more than one `Xxx_Indication` function called, according to [SWS_Dcm_00516], has returned `E_NOT_OK` and no function has returned `E_REQUEST_NOT_ACCEPTED`, the `DSD` submodule shall trigger a negative response using the ErrorCode parameter from the first `Xxx_Indication` returning `E_NOT_OK`.] (*RS_Diag_04011*)

7.5.4.5 Distribution of diagnostic message to **DSP** submodule

[SWS_Dcm_00221] [The **DSD** submodule shall search for the executable functionality of the **DSP** submodule for newly received diagnostic service identifier and shall call the corresponding **DSP** service interpreter.]()

7.5.4.6 Assemble positive or negative response

[SWS_Dcm_00222] [When the **DSP** submodule has finished the execution of the requested Diagnostic Service the **DSD** submodule shall assemble the response.]()

The execution of the **DSP** service interpreter can have the results:

- positive Result or
- negative Result.

Following possible Responses can be assembled:

- positive Response,
- negative Response, or
- no Response (in the case of suppression of responses).

7.5.4.6.1 Positive Response

[SWS_Dcm_00223] [The **DSD** submodule shall add the response service identifier and the response data stream (returned by the Application) in the parameter "Dcm_MsgContextType".]()

[SWS_Dcm_00224] [The **DSD** submodule shall therefore transfer the Dcm_MsgContextType into a (response) buffer and shall add the service identifier at the first byte of the buffer.]()

[SWS_Dcm_00225] [The **DSD** submodule shall execute the "Initiate transmission" functionality in the next execution step.]()

7.5.4.6.2 Negative Response

The **DSP** submodule can trigger the transmission of a negative response with a specific **NRC** to the **DSD** submodule. For the allowed **NRC** of the executed Service **ID** please refer to the specification of the service in ISO14229-1 [1] (see Section 4.2.4 Response code parameter definition Table 12) and ISO15031-5 [2]. The **DSP** and the Application have to take care of the correct use of **NRC** of the executed Service ID.

[SWS_Dcm_00228] [The **DSD** submodule shall handle all NRCs supported from the Application and defined in **Dcm_NegativeResponseCodeType**.]()

7.5.4.6.3 Suppression of response

[SWS_Dcm_00231] [In the case that the "suppressPosRspMsgIndicationBit" is indicated in the functionality "Handling of suppressPosRspMsgIndicationBit" (stored in the Variable **Dcm_MsgContextType** (Element: **Dcm_MsgAddInfo**)), the **DSD** submodule shall activate the suppression of Positive Responses.]()

[SWS_Dcm_00001] [In the case of a Negative Result of the execution and active **Functional Addressing** the **DSD** submodule shall activate the suppression of the following Negative Responses:

- **NRC** 0x11 (Service not supported),
- **NRC** 0x12 (SubFunction not supported),
- **NRC** 0x31 (Request out of range),
- **NRC** 0x7E (Subfunction not supported in active session),
- **NRC** 0x7F (Service not supported in active session)

](*RS_Diag_04020*)

7.5.4.7 Initiate transmission

[SWS_Dcm_00232] [The **DSD** submodule shall forward the diagnostic (response) message (positive or negative response) to the **DSL** submodule.]()

[SWS_Dcm_00237] [The **DSL** submodule shall forward the diagnostic (response) message (positive or negative response) further to the PduR module by executing a **DSL** transmit functionality.]()

The **DSL** submodule will receive a confirmation by the PduR module upon forwarding the data.

[SWS_Dcm_00235] [The **DSL** submodule shall forward the received confirmation from the PduR module to the **DSD** submodule.]()

[SWS_Dcm_00236] [The **DSD** submodule shall forward the confirmation via the internal function **DsInternal_DcmConfirmation()** to the **DSP** submodule.]()

[SWS_Dcm_00238] [In the case that no diagnostic (response) message shall be sent (Suppression of Responses) the **DSL** submodule shall not transmit any response.]()

In this case no Data Confirmation is sent from the **DSL** submodule to the **DSD** submodule but the **DSD** submodule will still call internal function **DsInternal_DcmConfirmation()**.

[SWS_Dcm_00240] [In case the request has been fully processed by the Dcm, The **DSD** submodule shall finish the processing of one Diagnostic Message of the Diagnostic Service Dispatcher by calling **DsInternal_DcmConfirmation()**.]()

Rationale for **[SWS_Dcm_00240]**: The **DSP** submodule is waiting for the execution of the **DsInternal_DcmConfirmation()** functionality. So it has to be sent, also when no Data Confirmation is provided. Altogether this means that in any of the following cases:

- Positive Response,
- Negative Response,
- Suppressed Positive Response, and
- Suppressed Negative Response

The **DSD** submodule will finish by calling **DsInternal_DcmConfirmation()** (refer to [8.10.3 DsInternal_DcmConfirmation](#)).

[SWS_Dcm_00741] [The **DSD** submodule shall call the operation **Xxx_Confirmation()** on all ports using the **ServiceRequestNotification** interface (see configuration parameter **DcmDsdServiceRequestManufacturerNotification** and **DcmDsdServiceRequestSupplierNotification**).]()

[SWS_Dcm_00742] [The call of **Xxx_Confirmation()** shall be done right after the call of **DsInternal_DcmConfirmation()**.]()

[SWS_Dcm_00677] [If the operation **Indication()** returns value **E_REQUEST_NOT_ACCEPTED**, the **Dcm** module shall not send any diagnostic response and shall end the current diagnostic request management.]()

[SWS_Dcm_00678] [If the operation **Indication()** returns value **E_NOT_OK**, the **Dcm** module shall send a negative response with **NRC** value equal to **ErrorCode** parameter value.]()

7.6 Diagnostic Service Processing (DSP)

7.6.1 General

When receiving a function call from the **DSD** submodule requiring the **DSP** submodule to process a diagnostic service request, the **DSP** always carries out following basic process steps:

- analyze the received request message,
- check format and whether the addressed subfunction is supported,
- acquire data or execute the required function call on the DEM, SW-Cs or other BSW modules
- assemble the response

The following sections are some general clarifications.

7.6.1.1 Check format and subfunction support

The **DSP** submodule will check for appropriate message length and structure before executing the requested command.

[SWS_Dcm_00272] [The **DSP** submodule shall trigger a negative response with **NRC** 0x13 (Incorrect message length or invalid format), when the analysis of the request message results in formatting or length failure.]()

Note: It is up to the implementation in which detail the format check might be executed and depends on the level of detail the diagnostic data description provides at compile time.

7.6.1.2 Assemble response

[SWS_Dcm_00039] [The **DSP** submodule shall assemble the response message excluding response service identifier and determine the response message length.]()

[SWS_Dcm_00038] [If the paged-buffer mechanism is used, the **DSP** submodule shall determine the overall response length before any data is passed to the **DSD** submodule or the **DSL** submodule respectively.]()

Requirement **[SWS_Dcm_00038]** is needed because of segmented diagnostic data transmission on **CAN** using ISO15765-2 [12], which requires the provision of the overall length of the complete data stream in the very first **CAN** frame of the respective data transmission (please refer to Section [7.4.4.9](#) for details about the paged-buffer mechanism).

7.6.1.3 Negative Response Codes handling

[SWS_Dcm_00271] [Unless another particular **NRC** is specified, the **DSP** submodule shall trigger a negative response with **NRC** 0x10 (generalReject), when the **API** calls made to execute the service do not return OK.]()

[SWS_Dcm_01414] Accepted range of Dcm_NegativeResponseCodeType for negative responses [If the **Dcm** calls an external application by any of the **APIs** having the out parameter **Dcm_NegativeResponseCodeType ErrorCode**, the **Dcm** shall accept only values in the range 0x01-0xFF in case the return value is **E_NOT_OK**.]()

[SWS_Dcm_01415] Behavior on application returning unexpected return code [If the **Dcm** calls an **API** with the out parameter **Dcm_NegativeResponseCodeType ErrorCode** and the application sets this parameter to **DCM_POS_RESP** and **E_NOT_OK** is returned, the **Dcm** shall report the runtime error **DCM_E_INVALID_VALUE**.]()

[SWS_Dcm_00275] [The [DSP](#) submodule shall trigger a negative response with [NRC 0x31](#) (Request out of range), when the analysis of the request message results in other unsupported message parameters.]()

7.6.1.4 Diagnostic mode declaration groups

[SWS_Dcm_00775] [The [Dcm](#) shall act as a mode manager for the diagnostic modes:

1. [DcmDiagnosticSessionControl](#) (service 0x10)
2. [DcmEcuReset](#) (partly service 0x11)
3. [DcmSecurityAccess](#) (service 0x27)
4. [DcmModeRapidPowerShutDown](#) (partly service 0x11)
5. [DcmCommunicationControl_<symbolic name of ComMChannelId>](#). (service 0x28)
6. [DcmControlDTCSetting](#) (service 0x85)
7. [DcmResponseOnEvent_<RoeEventID>](#) (service 0x86)
8. [DcmAuthenticationState_<Symbolic Name of DcmDslMainConnection>](#)

]()

Note: The RTE/SchM will prefix the names with "MODE_", wherefore the names do not include the MODE keyword.

[SWS_Dcm_01327] [The [Dcm](#) shall define the [ModeDeclarationGroupPrototype DcmSecurityAccess](#) as provided-ModeGroup based on the following ModeDeclarationGroup:

```
1 ModeDeclarationGroup DcmSecurityAccess {  
2     {  
3         DCM_SEC_LEV_LOCKED  
4         DCM_SEC_LEV_1  
5         ...  
6         DCM_SEC_LEV_63  
7     }  
8     initialMode = DCM_SEC_LEV_LOCKED  
9 };
```

]()

[SWS_Dcm_01328] [

```
1 ModeSwitchInterface SchM_Switch_<bsnp>_DcmSecurityAccess {  
2     isService = true;  
3     SecLevel currentMode;  
4 };
```

]()

[SWS_Dcm_00806] [The [Dcm](#) shall define the ModeDeclarationGroupPrototype DcmDiagnosticSessionControl as provided-ModeGroup based on the ModeDeclarationGroup DcmDiagnosticSessionControl.]()

[SWS_Dcm_00777] [The [Dcm](#) shall define the ModeDeclarationGroupPrototype DcmEcuReset as provided-ModeGroup in its Basic Software Module instance based on the ModeDeclarationGroup DcmEcuReset.]()

[SWS_Dcm_00807] [The [Dcm](#) shall define the ModeDeclarationGroupPrototype DcmModeRapidPowerShutDown as provided-ModeGroup in its Basic Software Module instance based on the ModeDeclarationGroup DcmModeRapidPowerShutDown.]()

[SWS_Dcm_00780] [The [Dcm](#) shall define for each network which is considered in the CommunicationControl service a separate ModeDeclarationGroupPrototype DcmCommunicationControl_<symbolic name of ComMChannelId> as provided-ModeGroup in its Basic Software Module instance based on the ModeDeclarationGroup DcmCommunicationControl.]()

[SWS_Dcm_00781] [The [Dcm](#) shall define the ModeDeclarationGroupPrototype DcmControlDTCSetting as provided-ModeGroup in its Basic Software Module instance based on the ModeDeclarationGroup DcmControlDTCSetting.]()

[SWS_Dcm_00933] [The [Dcm](#) shall define for each RoeEvent a separate ModeDeclarationGroupPrototype DcmResponseOnEvent_<Symbolic name of RoeEventId> as provided-ModeGroup in its Basic Software Module instance based on the ModeDeclarationGroup DcmResponseOnEvent.]()

The [Dcm](#) provides a state machine for each RoeEvent (see Figure 7.4). The state for a RoeEvent is needed by SWC to activate event reporting or report the Roe status to a Did. Therefore the [Dcm](#) provides for each state of each RoeEvent a ModeDeclarationGroupPrototype which reports the current state of the state machine as mode.

[SWS_Dcm_00934] [The ModeDeclarationGroupPrototype shall represent the current state of the ROE state machine for this RoeEvent.]()

7.6.1.5 Environmental condition dependent execution

The execution of a diagnostic service or the acceptance of certificates can be restricted to a mode condition. This enables the [Dcm](#) to formalize environmental checks. For diagnostic service processing, a further check (see [\[SWS_Dcm_00773\]](#) and [\[SWS_Dcm_00774\]](#)) can be configured to the [Dcm](#). This is like session and security checks. The referenced mode rule is arbitrating on to several mode declarations of a mode declaration groups in which the request can be processed. Otherwise a configurable NRC (see [\[SWS_Dcm_00812\]](#)) is responded. The same mode rule checks can be applied on certificate validation. Certificates can be restricted to certain vehicle properties, such as VIN or a certain version number. Only if all the conditions are valid, the certificate is accepted by the [Dcm](#).

[SWS_Dcm_00808] [The [DcmModeRule](#) shall evaluate all referenced [DcmModeConditions](#) and/or nested [DcmModeRules](#) either by a logical AND in case [DcmLogicalOperator](#) is set to [DCM_AND](#) or by a logical OR in case the [DcmLogicalOperator](#) is set to [DCM_OR](#). In case only a single [DcmModeCondition](#) or [DcmModeRule](#) is referenced the [DcmLogicalOperator](#) shall not be present and therefore not be used.] ()

[SWS_Dcm_CONSTR_6028] [[DcmModeCondition](#) shall either have a [DcmBswModeRef](#) or a [DcmSwcModeRef](#) or a [DcmSwcSRDataElementRef](#) as external reference.] ()

[SWS_Dcm_00810] [The [DcmSwcModeRef](#) and [DcmBswModeRef](#) of [DcmModeConditions](#) shall evaluate if the referenced Mode-Declaration is set in case of [DcmConditionType](#) is set to [DCM_EQUALS](#) or is not set in case of [DcmConditionType](#) is set to [DCM_EQUALS_NOT](#).] ()

[SWS_Dcm_01119] Mode condition evaluation [For each mode condition, the [Dcm](#) shall compare a compare value with a S/R data element. The compare value is provided by [DcmSwcSRDataElementValueRef](#) or [DcmModeConditionConnectionCertificateCompareElementRef](#) and the S/R Element is by [DcmSwcSRDataElementRef](#). The mode condition is evaluated to true if the S/R data element value is:

- equal to the compare value in case of [DcmConditionType](#) is set to [DCM_EQUALS](#)
- unequal to the compare value in case of [DcmConditionType](#) is set to [DCM_EQUALS_NOT](#)
- greater than the compare value in case of [DcmConditionType](#) is set to [DCM_GREATER_THAN](#)
- greater or equal than the compare value in case of [DcmConditionType](#) is set to [DCM_GREATER_OR_EQUAL](#)
- less than the compare value in case of [DcmConditionType](#) is set to [DCM_LESS_THAN](#)
- less or equal than the compare value in case of [DcmConditionType](#) is set to [DCM_LESS_OR_EQUAL](#).

] ()

[SWS_Dcm_CONSTR_6029] [The values [DCM_GREATER_THAN](#), [DCM_GREATER_OR_EQUAL](#), [DCM_LESS_OR_EQUAL](#) and [DCM_LESS_THAN](#) shall not be used with a Mode reference ([DcmBswModeRef](#) or [DcmSwcModeRef](#)) .] ()

Note: The current mode of the referenced ModeDeclarationGroupPrototypes could be read by either the [API SchM_Mode](#) (in case of [DcmBswModeRef](#)) or by the [API Rte_Mode](#) (in case of [DcmSwcModeRef](#)).

[SWS_Dcm_00811] [In case multiple DcmModeConditions are referenced within a DcmModeRule they shall be evaluated in order of the index attributes of the EcucReferenceValues for DcmArgumentRef.]()

Note: This implies the priority of NRCs

[SWS_Dcm_00782] [If a DcmModeRule is not referenced from the DcmDspAuthenticationConnection, the Dcm shall use the optional parameter DcmModeRuleNrcValue as NegativeResponseCode in case the mode rule is evaluated to false.]()

Mode rules for DcmDspAuthenticationConnection are not part of the NRC evaluation.

[SWS_Dcm_00812] [In case a nested DcmModeRule contains also a DcmModeRuleNrcValue parameter, this NRC shall be used prior the higher-level NRC.]()

[SWS_Dcm_00813] [In case DcmLogicalOperator is set to DCM_AND, the first failed DcmModeRule with an explicit configured NRC (DcmModeRuleNrcValue) shall be used to define the NRC for the response message.]()

[SWS_Dcm_00814] [In case DcmLogicalOperator is set to DCM_OR, the last failed DcmModeRule with an explicit configured NRC (DcmModeRuleNrcValue) shall be used to define the NRC for the response message.]()

Note: The difference in the AND and OR logical operation is to allow an optimized implementation.

[SWS_Dcm_00815] [In case the complete evaluation result in no specific NRC the NRC 0x22 (ConditionsNotCorrect) shall be used.]()

[SWS_Dcm_00942] [The Dcm shall create for commonly used ModeDeclarationGroupPrototype of each DcmSwcModeRef of DcmModeConditions a required mode switch port referencing this ModeDeclarationGroupPrototype. The name pattern of this port prototype shall be DcmModeUser_<ModeDeclarationGroupPrototype>" in case the ModeDeclarationGroupPrototype shortname is unique. Otherwise the name pattern is implementation specific, except the required prefix "DcmModeUser_".]()

Note: ModeDeclarationGroupPrototypes are not necessarily unique, wherefore the exception is required to avoid name clashes in the Dcm Service-SWC.

Examples on using mode dependent request execution:

General assumptions:

1. DcmModeRule1 consists of DcmModeCondition1, DcmModeRule2 and DcmModeRule3
2. DcmModeRule1 defines NRC 0x22
3. DcmModeRule2 and DcmModeRule3 do not have any sub-rules
4. DcmModeRule2 defines NRC 0x72
5. DcmModeRule3 does not define a NRC value

Example 1:

- 1) DcmModeRule1 uses an OR combination (DcmModeCondition1 OR DcmModeRule2 OR DcmModeRule3)
 - a) DcmModeCondition1 is failing
→ **NRC** 0x22 is returned
 - b) DcmModeRule2 is failing
→ **NRC** 0x72 is returned
 - c) DcmModeRule3 is failing
→ **NRC** 0x22 is returned
 - d) DcmModeCondition1, DcmModeRule2 and DcmModeRule3 are failing
→ **NRC** 0x72 is returned
 - e) DcmModeCondition1 and DcmModeRule3 are failing
→ **NRC** 0x22 is returned

Example 2:

- 1) DcmModeRule1 uses an AND combination (DcmModeCondition1 AND DcmModeRule2 AND DcmModeRule3)
 - a) DcmModeCondition1 is failing
→ **NRC** 0x22 is returned
 - b) DcmModeRule2 is failing
→ **NRC** 0x72 is returned
 - c) DcmModeRule3 is failing
→ **NRC** 0x22 is returned
 - d) DcmModeCondition1, DcmModeRule2 and DcmModeRule3 are failing
→ **NRC** 0x22 is returned
 - e) DcmModeCondition1 and DcmModeRule3 are failing
→ **NRC** 0x22 is returned
 - e) DcmModeRule2 and DcmModeRule3 are failing
→ **NRC** 0x72 is returned

[SWS_Dcm_CONSTR_6089] Only one compare element [In one [DcmModeCondition](#) only one of the elements [DcmSwcSRDataElementRef](#) or [DcmModeConditionCertificateCompareElementRef](#) shall be configured.] ([RS_Diag_04232](#))

[SWS_Dcm_CONSTR_6090] Use of certificate compare elements [The [DcmModeConditionCertificateCompareElementRef](#) is only allowed, if the parent [DcmModeRule](#) is referenced from a [DcmDspAuthenticationConnection](#).] ()

7.6.1.6 Sender/Receiver Communication

[SWS_Dcm_00964] [If [DcmDspDiagnosisScaling](#) is present, the [Dcm](#) shall derive the [CompuMethod](#) from the [DcmDspDiagnosisScaling](#) container and add it to the [DataType](#) in their respective port interface for S/R port of [DataServices_Data](#) [\[SWS_Dcm_01035\]](#).] ()

7.6.1.7 Passing SwDataDefProps properties from DEXT file to the [Dcm](#) Service [SW-C](#)

UseCase: Pass the SwDataDefProps details like CompuMethod, DataConstraints and Units to the [Dcm](#) Service [SW-C](#) and make them there available per [DID](#) DataElement / per RoutineControl signal. Two alternative work flows are available.

7.6.1.7.1 [DcmDspDiagnosticDataElementRef](#) workflow

Figure 7.6: [DcmDspDiagnosticDataElementRef](#) Workflow

The feature of the [DcmDspDiagnosticDataElementRef](#) workflow is the use of a **EcucForeignReference** inside the generated **EcuC** values. While importing the **DEXT** information, a dedicated **EcuC** parameter is generated, which holds a **EcucForeignReference** named [DcmDspDiagnosticDataElementRef](#) to a **DiagnosticDataElement** in the **DEXT** file. This **EcucForeignReference** enables the access to all **SwDataDefProps** (**BaseType**, **CompuMethod**, **DataConstr**, etc.) of the corresponding **DiagnosticDataElement**. The container [DcmDspAlternativeDiagnosticDataElement](#) aggregates this **EcucForeignReference**. In the process step of generating the corresponding Service SWC all needed content will be copied directly based on the **EcucForeignReference** from **DEXT** to the Service [SW-C](#). In this work flow the existence of the **DEXT** file while the generation of the Service [SW-C](#) is required.

[SWS_Dcm_CONSTR_6053] [The aggregation of [DcmDspTextTableMapping](#) at [DcmDspAlternativeDataType](#) is only valid if the category of the **CompuMethod**

of the DataType referenced by DcmDspAlternativeDataType.DcmApplicationDataType has category set to TEXTTABLE or SCALE_LINEAR_AND_TEXTTABLE.]()

7.6.1.7.2 [DcmDspAlternativeDataType.DcmApplicationDataType](#) workflow

Figure 7.7: [DcmDspAlternativeDataType.DcmApplicationDataType](#) Workflow

The feature of the [DcmDspAlternativeDataType.DcmApplicationDataType](#) workflow is that while importing the DEXT information beside the EcuC values also a [SW-C](#) fragment is generated. In this [SW-C](#) fragment all needed SwDataDefProps are directly copied from the DEXT file. Inside the generated EcuC values the EcuC parameter [DcmDspAlternativeDataType.DcmApplicationDataType](#) refers to the SWC fragment and enables the access to all SwDataDefProps (BaseType, CompuMethod, DataConstr, etc.). In the process step of generating the corresponding Service [SW-C](#), all needed content will be included based on the reference from [DcmDspAlternativeDataType.DcmApplicationDataType](#) to the [SW-C](#) fragment. In this work flow the existence of the DEXT file while the generation of the Service [SW-C](#) is not required.

7.6.1.8 Asynchronous call behavior

[SWS_Dcm_01412] [If a [Dem](#) function returns DEM_PENDING, the [Dcm](#) shall call this function again at a later point in time as long as DEM_PENDING is returned.]()

[SWS_Dcm_00120] [If the number of negative responses for a requested diagnostic tasks (see [\[SWS_Dcm_00024\]](#)) reaches the value defined in the configuration parameter `DcmDslDiagRespMaxNumRespPend`, the `Dcm` module shall stop processing the active diagnostic request, inform the application or BSW (if this diagnostic task implies the call to a `SW-C` interface or a BSW interface) by setting `OpStatus` parameter, of active port interface, to `DCM_CANCEL`, report the runtime error `DCM_E_INTERFACE_TIMEOUT` and shall send a negative response with `NRC 0x10` (General reject).]()

[SWS_Dcm_01184] [The `Dcm_SetProgConditions` API shall be called again in the next `Dcm` main function cycle if previous return status was `E_PENDING`.]()

[SWS_Dcm_00760] [The return of `DCM_E_PENDING` shall do a re-triggering (e.g. in the next MainFunction cycle).]()

[SWS_Dcm_01413] [The return values of interfaces called with an `OpStatus` equal to `DCM_CANCEL` shall be ignored]()

7.6.2 UDS Services

[SWS_Dcm_00442] [The `Dcm` module shall implement the services of `UDS` according to Table [7.5](#).]()

SID	Service	Subfunction	Supported
0x10	DiagnosticSessionControl		Supported
0x11	ECUReset		Supported
0x14	ClearDiagnosticInformation		Supported
0x19	ReadDTCInformation		Supported
0x22	ReadDataByIdentifier		Supported
0x23	ReadMemoryByAddress		Supported (callout)
0x24	ReadScalingDataByIdentifier		Supported
0x27	SecurityAccess		Supported
0x28	CommunicationControl		Supported
0x29	Authentication		Supported
0x2A	ReadDataByPeriodicIdentifier		Supported
0x2C	DynamicallyDefineDataIdentifier		Supported
0x2E	WriteDataByIdentifier		Supported
0x2F	InputOutputControlByIdentifier		Supported
0x31	RoutineControl		Supported
0x34	RequestDownload		Supported (callout)
0x35	RequestUpload		Supported (callout)
0x36	TransferData		Supported
0x37	RequestTransferExit		Supported
0x38	RequestFileTransfer		Supported (callout)
0x3D	WriteMemoryByAddress		Supported (callout)
0x3E	TesterPresent		Supported
0x83	AccessTimingParameter		NRC "ServiceNotSupported"
0x84	SecuredDataTransmission		NRC "ServiceNotSupported"
0x85	ControlDTCSetting	On, off	Supported

SID	Service	Subfunction	Supported
0x86	ResponseOnEvent	All excepted onComparisionOfValues and OnTimerInterrupt	Supported
0x87	LinkControl		User optional

Table 7.5: Support of **UDS** Services

7.6.2.1 General behavior using DEM interfaces

[SWS_Dcm_00007] [The **Dcm** module shall retrieve the DTCStatusAvailabilityMask by using the function **Dem_GetDTCStatusAvailabilityMask().**]()

The mask DTCStatusAvailabilityMask reflects the status bits supported by the ECU.

Note : Masking is performed in the module **Dem** and does not need to be done on **Dcm** side (see **SWS_Dem_00657** in [13]).

[SWS_Dcm_00371] [To ensure consistent event related data during the reading sequence, the **Dcm** module shall lock the update of event related data before reading freeze frames or extended data records. The **Dcm** shall lock the update using the **Dem** API **Dem_DisableDTCRecordUpdate()**. After the locking the **Dcm** shall read the event related data by calls to:

- **Dem_SelectExtendedDataRecord()**
- **Dem_GetSizeOfExtendedDataRecordSelection()**
- **Dem_GetNextExtendedDataRecord()**
- **Dem_SelectFreezeFrameData()**
- **Dem_GetSizeOfFreezeFrameSelection()** and
- **Dem_GetNextFreezeFrameData()** After the event related data is read, the **Dcm** shall re-enable updates by calling **Dem_EnableDTCRecordUpdate()**.

]()

[SWS_Dcm_00702] [If function **Dem_DisableDTCRecordUpdate()** returns **DEM_PENDING**, the **Dcm** shall retry to get the lock in the next **Dcm_MainFunction().**]()

[SWS_Dcm_00700] [When the **Dcm** module receives a request with the DTCStatusMask set to 0x00, it shall send positive response and shall not use the **Dem** interface **Dem_SetDTCFilter().**]()

Note: The parameter **DTCFormat** of the functions **Dem_ClearDTC()**, **Dem_SetDTCFilter()**, **Dem_SetFreezeFrameRecordFilter()** and **Dem_GetNextFilteredDTCAndFDC()** defines the output-format of the requested **DTC** values for the sub-sequent **API** calls. For the 2-byte ISO15031-6 [14] **DTC** format, the **DTCFormat** parameter shall be equal to **DEM_DTC_FORMAT_OBD**. For

the 2-byte ISO14229-1 [DTC](#) format, the DTCFormat parameter shall be equal to DEM_DTC_FORMAT_UDS.

[SWS_Dcm_01160] [When the [Dcm](#) module receives a request with the DTCSeverityMask set to 0x00, it shall send a positive response as specified in ISO14229-1 [\[1\]](#) and shall not use the [Dem](#) interface Dem_SetDTCFilter().]

[SWS_Dcm_00835] [The [Dcm](#) shall call Dem_SetDTCFilter prior to Dem_GetNumberOfFilteredDTC, any sequence of Dem_GetNextFilteredDTC, any sequence of Dem_GetNextFilteredDTCAndFDC, as well as any sequence of Dem_GetNextFilteredDTCAndSeverity.]

[SWS_Dcm_00836] [The [Dcm](#) shall call Dem_SetFreezeFrameRecordFilter prior to any sequence of Dem_GetNextFilteredRecord.]

[SWS_Dcm_01127] [The [Dcm](#) module shall retrieve the DTCSeverityAvailabilityMask by using the function Dem_GetDTCSeverityAvailabilityMask().]

Note: The mask DTCSeverityAvailabilityMask reflects the severity bits supported by the ECU.

[SWS_Dcm_01212] [If Dem_DisableDTCRecordUpdate() returns DEM_WRONG_DTC, the [Dcm](#) shall send a [NRC](#) 0x31 (RequestOutOfRange).]

[SWS_Dcm_01213] [If Dem_DisableDTCRecordUpdate() returns DEM_WRONG_DTCORIGIN, the [Dcm](#) shall send a [NRC](#) 0x31 (RequestOutOfRange).]

[SWS_Dcm_01234] [If Dem_GetNextFilteredDTCAndSeverity() returns DEM_NO_SUCH_ELEMENT and at least one matching element could be retrieved before, the [Dcm](#) shall send a positive response including these data elements.]

[SWS_Dcm_01235] [If Dem_GetNextFilteredDTCAndSeverity() returns DEM_NO_SUCH_ELEMENT and no matching element could be retrieved before, the [Dcm](#) shall send a positive response only for service, subservice and mandatory data specified in ISO 14229-1 [\[1\]](#).]

[SWS_Dcm_01242] [If Dem_GetSizeOfExtendedDataRecordSelection() returns DEM_WRONG_DTC, DEM_WRONG_DTCORIGIN or DEM_NO_SUCH_ELEMENT, the [Dcm](#) shall send a [NRC](#) 0x31 (RequestOutOfRange).]

[SWS_Dcm_01250] [If Dem_GetStatusOfDTC() returns DEM_WRONG_DTC or DEM_WRONG_DTCORIGIN, the [Dcm](#) shall send a [NRC](#) 0x31 (RequestOutOfRange).]

[SWS_Dcm_01409] [If Dem_GetStatusOfDTC() returns DEM_NO_SUCH_ELEMENT, the [Dcm](#) shall send a positive response only for service and subservice.]

[SWS_Dcm_01255] [If Dem_SetDTCFilter() returns E_NOT_OK, the **Dcm** shall send a **NRC** 0x31 (RequestOutOfRange).]()

7.6.2.2 Service 0x10 - Diagnostic Session Control

UDS Service 0x10 allows an external tester to enable different diagnostic sessions in the server. A diagnostic session enables a specific set of diagnostic services and/or functionality in the server. The service request contains the parameter:

- **diagnosticSessionType**

[SWS_Dcm_00250] [The **Dcm** module shall implement the **UDS** Service 0x10.] (*RS-Diag_04006*)

[SWS_Dcm_00307] [When responding to **UDS** Service 0x10, if the requested subfunction value is not configured in the ECU (configuration parameter **DcmDspSessionLevel**), the **DSP** submodule shall trigger a negative response with **NRC** 0x12 (SubFunction not supported).]()

If the requested subfunction value is configured, the following steps are processed even if the requested session type is equal to the already running session type (see ISO14229-1 [1] Section 9.2).

[SWS_Dcm_00311] [The send confirmation function shall set the new diagnostic session type with **Ds1Internal_SetSesCtrlType()** and shall set the new timing parameters (P2ServerMax, P2ServerMax*) (see configuration parameters **DcmDspSessionP2ServerMax** and **DcmDspSessionP2StarServerMax**) and do the mode switch of the **ModeDeclarationGroupPrototype** **DcmDiagnosticSessionControl** by calling **SchM_Switch_<bsnp>_DcmDiagnosticSessionControl()** with the new diagnostic session type (see [SWS_Dcm_91019]).] (*RS_Diag_04248*)

[SWS_Dcm_00085] [The **DSP** submodule shall manage internally a read access for the dataidentifier 0xF186 (ActiveDiagnosticSessionDataIdentifier) defined in ISO14229-1 [1].]()

7.6.2.3 Service 0x11 - ECURest

UDS Service ECURest (0x11) allows an external tester to request a server reset. The service request contains parameter:

- **resetType**

[SWS_Dcm_00260] [The **Dcm** module shall implement the **UDS** Service ECURest (0x11).]()

[SWS_Dcm_00373] [On reception of a request for [UDS](#) Service 0x11 with the sub functions other than enableRapidPowerShutDown (0x04) or disableRapidPowerShutDown (0x05), the [Dcm](#) module shall trigger the mode switch of ModeDeclarationGroupPrototype DcmEcuReset equal to the received resetType. After the mode switch is requested the [Dcm](#) shall trigger the start of the positive response message transmission. Sub function hardReset (0x01) to HARD Sub function keyOffOnReset (0x02) to KEYONOFF Sub function softReset (0x03) to SOFT.]()

Note: By this mode switch the [Dcm](#) informs the BswM to carry out necessary actions for the handling of this individual reset type. These actions can be configured within the BswM action list corresponding to the requested reset type. Here the integrator can also define if an ECU reset will finally be performed or not.

[SWS_Dcm_00594] [On the transmit confirmation (call to [Dcm_TpTxConfirmation](#)) of the positive response, the [Dcm](#) module shall trigger the mode switch of ModeDeclarationGroupPrototype DcmEcuReset to the mode EXECUTE (via SchM_Switch_<bsnp>_DcmEcuReset(RTE_MODE_DcmEcuReset_EXECUTE)).]()

Note: By this mode switch the [Dcm](#) requests the BswM to perform the final processing on the reset type according to the configured action list.

[SWS_Dcm_00818] [On reception of a request for [UDS](#) Service 0x11 with the sub functions enableRapidPowerShutdown (0x04) or disableRapidPowerShutdown (0x05), the [Dcm](#) module shall trigger the mode switch of ModeDeclarationGroupPrototype DcmRapidPowerShutdown: Sub function enableRapidPowerShutdown (0x04) to ENABLE_RAPIDPOWERSHUTDOWN, Sub function disableRapidPowerShutdown (0x05) to DISABLE_RAPIDPOWERSHUTDOWN.]()

Note: If EnableRapidPowerShutdown is enabled, the ECU should shorten its power-down time.

[SWS_Dcm_00589] [In case the parameter [DcmDspPowerDownTime](#) is present, the [Dcm](#) shall set the powerDownTime in positive response to sub-service enableRapidPowerShutdown with value set in [DcmDspPowerDownTime](#).]()

[SWS_Dcm_00834] [After sending the positive response of EcuReset (call of [Dcm_TpTxConfirmation](#)) the [Dcm](#) shall ignore all further requests during reset-processing.]()

[SWS_Dcm_CONSTR_6080] [DcmDspEcuResetRow](#) container configuration [One container [DcmDspEcuResetRow](#) shall be configured for each [DcmDsdSubService](#) ([DcmDspEcuResetId](#) matching to the [DcmDsdSubServiceId](#)) configured for the [UDS](#) service ECUReset (0x11) which does not have the corresponding [DcmDsdSubServiceFnc](#) parameter configured.] ([RS_Diag_04098](#))

7.6.2.4 Service 0x14 - Clear Diagnostic Information

[UDS](#) Service ClearDiagnosticInformation (0x14) requests an ECU to clear the error memory. The service request contains the parameter:

- groupOfDTC.

[SWS_Dcm_00247] [The [Dcm](#) module shall implement [UDS](#) Service 0x14.]()

[SWS_Dcm_01263] [Upon reception of a [UDS](#) Service ClearDiagnosticInformation (0x14) request with parameter groupOfDTC, the [Dcm](#) module shall call the [API](#) Dem_SelectDTC() with the following parameter values:

- ClientId: Client Id for this [Dcm](#) instance (see [DcmDemClientRef](#))
- DTC: groupOfDTC from the service request
- DTCFormat: DEM_DTC_FORMAT_UDS
- DTCOrigin: DEM_DTC_ORIGIN_PRIMARY_MEMORY

]([RS_Diag_04058](#))

[SWS_Dcm_01400] [After call of Dem_SelectDTC() the [Dcm](#) shall call Dem_GetDTCSelectionResultForClearDTC() with the following parameter value:

- ClientId: Client Id for this [Dcm](#) instance (see [DcmDemClientRef](#)).

]()

[SWS_Dcm_01265] [In case Dem_GetDTCSelectionResultForClearDTC() returns DEM_WRONG_DTC, the [Dcm](#) shall send a [NRC](#) 0x31 (RequestOutOfRange).]()

[SWS_Dcm_01268] [In case Dem_GetDTCSelectionResultForClearDTC() returns E_OK, the [Dcm](#) module shall check if application allows to clear the [DTC](#) (according to the configuration parameter [DcmDspClearDTCCheckFnc](#)). If not, the [Dcm](#) module shall send a negative response with [NRC](#) set to value from the parameter "ErrorCode".]()

[SWS_Dcm_01269] [In case application allows to clear the [DTC](#), the [Dcm](#) module shall check if the [DTC](#) can be cleared in the current mode condition (according to the configuration parameter [DcmDspClearDTCModeRuleRef](#)). If not, the [Dcm](#) module shall send the calculated negative response code of the referenced [DcmModeRule](#).]()

[SWS_Dcm_00005] [If the condition checks are successfully done, the [Dcm](#) module shall call Dem_ClearDTC with the following parameter values:

- ClientId = Client Id for this [Dcm](#) instance (see [DcmDemClientRef](#))

]([RS_Diag_04058](#))

[SWS_Dcm_00705] [In case Dem_ClearDTC() returns E_OK, the [Dcm](#) module shall send a positive response.]()

[SWS_Dcm_00707] [In case Dem_ClearDTC() returns DEM_CLEAR_FAILED, the [Dcm](#) shall send a negative response 0x22 (conditionsNotCorrect).]()

[SWS_Dcm_00708] [In case Dem_ClearDTC() returns DEM_WRONG_DTC, the [Dcm](#) shall send a negative response 0x31 (requestOutOfRange).]()

[SWS_Dcm_00966] [In case Dem_ClearDTC() returns DEM_CLEAR_BUSY, the **Dcm** shall send a negative response 0x22 (conditionsNotCorrect).]()

[SWS_Dcm_01060] [In case Dem_ClearDTC() returns DEM_CLEAR_MEMORY_ERROR, the **Dcm** shall trigger a negative response with **NRC** 0x72 (generalProgrammingFailure).]()

[SWS_Dcm_01408] [In case Dem_ClearDTC() returns DEM_WRONG_DTCORIGIN, the **Dcm** shall trigger a negative response 0x31 (requestOutOfRange).]()

7.6.2.5 Service 0x19 - Read **DTC** Information

Service 0x19 allows a client to read the status of server resident Diagnostic Trouble Code (**DTC**) information.

[SWS_Dcm_00248] [The **Dcm** module shall implement the **UDS** Service 0x19.]()

To setup the retrieval of specific data from the **Dem** module, the **Dcm** will call different filter **APIs** (Dem_SetDTCFilter(), Dem_SetFreezeFrameRecordFilter(), Dem_SelectFreezeFrameData() and Dem_SelectExtendedDataRecord()).

[SWS_Dcm_01043] [In case E_NOT_OK is returned by Dem_SetDTCFilter(), the **Dcm** module shall send a negative response with **NRC** 0x31 (requestOutOfRange).]()

[SWS_Dcm_01334] [For all sub-functions addressing user defined fault memory, before calling the appropriate **Dem** API, the **Dcm** shall add the value 0x0100 to the received selection request parameter MemorySelection in order to match the Dem_DTCOriginType.]()

7.6.2.5.1 Subfunctions 0x01, 0x07, 0x11 and 0x12

UDS Service 0x19 with subfunctions 0x01, 0x11 or 0x12 requests the ECU to report the number of DTCs matching tester-defined criteria. The service request contains the parameter:

- DTCStatusMask

UDS Service 0x19 with subfunction 0x07 requests the ECU to report the number of DTCs matching tester-defined criteria. The service request contains the parameters:

- DTCSeverityMask
- DTCStatusMask

[SWS_Dcm_00376] [When sending a positive response to **UDS** Service 0x19 with subfunction 0x01, 0x07, 0x11 or 0x12, the **Dcm** module shall use the data in the response message according to Table 7.6.]()

Parameter name	Value

Figure 7.8: Request DTC Snapshot Record Identification

[SWS_Dcm_00298] [When UDS Service 0x19 with subfunction 0x03 is requested, the DSP submodule shall retrieve the number of stored freeze frame records by calling `Dem_SetFreezeFrameRecordFilter()` with DTCFormat equal to `DEM_DTC_FORMAT_UDS` and `Dem_GetNumberOfFreezeFrameRecords()`.] ()

[SWS_Dcm_00299] [When responding to UDS Service 0x19 with subfunction 0x03, the Dcm module shall obtain the consecutive DTCs and DTCsnapshotRecordNumbers by repeatedly calling `Dem_GetNextFilteredRecord()`.] ()

When using paged buffer mechanism, in some case, it's possible that the number of DTC matching the filter change between the calculation of the total size, needed for the first page transmission, and the sending of the further pages. For this reason, the requirement [\[SWS_Dcm_00587\]](#) and [\[SWS_Dcm_00588\]](#) shall be considered for the implementation of this subservice.

[SWS_Dcm_01237] [If `Dem_GetNextFilteredRecord()` returns `DEM_NO SUCH ELEMENT` and at least one matching element could be retrieved before, the Dcm shall send a positive response including these data elements.] ()

[SWS_Dcm_01238] [If `Dem_GetNextFilteredRecord()` returns `DEM_NO SUCH ELEMENT` and no matching element could be retrieved before, the Dcm shall send a positive response only for service and subservice.] ()

[SWS_Dcm_01256] [If `Dem_SetFreezeFrameRecordFilter()` returns `E_NOT_OK`, the Dcm shall send a NRC 0x31 (RequestOutOfRange).] ()

7.6.2.5.7 Subfunctions 0x04 and 0x18

Using UDS Service 0x19 with subfunction 0x04 or 0x18, an external tester can request FreezeFrame information for one or all FreezeFrames of a specific DTC. The service request contains parameters:

- DTCMaskRecord
- DTCSnapshotRecordNumber

The subfunction 0x18 has an additional MemorySelection.

Figure 7.9: Request DTC Snapshot Record by Snapshot Record Number

[SWS_Dcm_01546] Read user defined memory snapshot record authentication check [On reception of the UDS Service ReadDTCInformation (0x19) with subfunction reportUserDefMemoryDTCSnapshotRecordByDTCNumber (0x18), the Dcm shall check if the access to the selected user defined memory in parameter MemorySelection is authenticated and read the DTC information only if:

- a DcmDspReadDTCInformationUserDefinedFaultMemoryRole is configured with DcmDspReadDTCInformationUserDefinedFaultMemoryRoleId matching the MemorySelection and the verification according to [SWS_Dcm_01522] was successful or
- the active white list on that connection has for that requested user defined memory selection one entry.

](RS_Diag_04233)

According to [SWS_Dcm_01546] the authentication checks are only executed if DcmDspAuthentication is configured. In case of a failed authentication the NRC handling is according to [SWS_Dcm_01485] and [SWS_Dcm_01551] applies.

[SWS_Dcm_00302] [When sending a positive response to [UDS](#) Service 0x19 with subfunction 0x04 or 0x18, the [Dcm](#) module shall use the data in the response message according to Table 7.16.]()

- [DTC](#): [DTC](#) from the request
- DTCOrigin: Memory Selection from request + 0x0100

and then Dem_GetStatusOfDTC() with ClientId = [DcmDemClientRef](#)] ([RS_Diag_04058](#))

[SWS_Dcm_00384] [Upon reception of [UDS](#) Service 0x019 with subfunction 0x04 or 0x18, the [Dcm](#) shall retrieve from the [Dem](#) the stored snapshot records for the requested [DTC](#) and origin.] ([RS_Diag_04058](#))

[SWS_Dcm_00441] [The `Dcm` module shall obtain the size of the data returned by `Dem` in `Dem_GetNextFreezeFrameData()` call by using `Dem_GetSizeOfFreezeFrameSelection()`.]()

To get the size of all FreezeFrame data, the `Dcm` module calls `Dem_SelectFreezeFrameData()` with RecordNumber set to 0xFF.

[SWS_Dcm_01220] [If `Dem_GetNextFreezeFrameData()` returns `DEM_WRONG_DTC` or `DEM_WRONG_DTCORIGIN` the `Dcm` shall send a `NRC 0x31 (RequestOutOfRange)`.]()

[SWS_Dcm_01430] [When responding to `UDS` Service 0x19 with subfunction 0x04, or 0x18, the `Dcm` shall collect the freeze frame data by first calling `Dem_SelectFreezeFrameData()` and then call `Dem_GetNextFreezeFrameData()` repeatedly until `DEM_NO SUCH ELEMENT` is returned.]()

[SWS_Dcm_01224] [If at least one of the requested freeze frame data is supported, the `Dcm` shall send a positive response. Otherwise the `Dcm` shall send a `NRC 0x31 (RequestOutOfRange)`.]()

[SWS_Dcm_01246] [If `Dem_GetSizeOfFreezeFrameSelection()` returns `DEM_WRONG_DTC`, `DEM_WRONG_DTCORIGIN` or `DEM_NO SUCH ELEMENT` the `Dcm` shall send a `NRC 0x31 (RequestOutOfRange)`.]()

7.6.2.5.8 Subfunction 0x05

`UDS` Service 0x19 with subfunction 0x05 allows an external tester to request Freeze-Frame information for a specific FreezeFrame record number. The service request contains parameter:

- `DTCStoredDataRecordNumber`

Due to `Dem` limitation, the diagnostic service \$19 05 is limited to the `OBD` legislative freeze frame.

[SWS_Dcm_00632] [On reception of service 0x19 with subfunction 0x05, if the record number of the diagnostic request is different from 0x00, the `Dcm` module shall send a negative response with `NRC 0x31 (request out of range)`.]()

[SWS_Dcm_00574] [When sending a positive response to `UDS` Service 0x19 with subfunction 0x05 and `DTCStoredDataRecordNumber` is 0x00, the `Dcm` module shall use the data in the response message according to Table 7.17.]()

Parameter name	Value
<code>DTCStoredDataRecordNumber</code>	<code>DTCStoredDataRecordNumber</code> from request (0x00)
<code>DTCAndStatusRecord</code>	<code>DTC</code> according to [SWS_Dcm_01193], <code>statusOfDTC</code> according to [SWS_Dcm_00389]
<code>DTCStoredDataRecordNumberOfIdentifiers</code> / <code>DTCStoredDataRecord</code>	As defined in [SWS_Dcm_00388]

Table 7.17: Subfunction 0x05 response values

[SWS_Dcm_00388] [When responding to [UDS](#) Service 0x19 with subfunction 0x05 and DTCStoredDataRecordNumber is 0x00, the [Dcm](#) shall compose the [OBD](#) Freeze-frame by looping all [DcmDspPid](#) and collecting all [DcmDspPidData](#) which are configured for service 0x02 by calling [Dem_DcmReadDataOfOBDFreezeFrame\(\)](#) for the Data Element. The [Dcm](#) shall compose the DidId by adding 0xF400 to the Pid, and calculate padding and supported informations.] ([RS_Diag_04058](#))

[SWS_Dcm_01193] [When responding to [UDS](#) Service 0x19 with subfunction 0x05 and DTCStoredDataRecordNumber is 0x00, the [Dcm](#) shall call [Dem_DcmGetDTCOfOBDFreezeFrame\(\)](#) with FrameNumber 0x00 and DTCFormat [DEM_DTC_FORMAT_UDS](#) to retrieve the [DTC](#) of the provided FreezeFrame.] ()

[SWS_Dcm_00389] [When responding to [UDS](#) Service 0x19 with subfunction 0x05 and DTCStoredDataRecordNumber is 0x00, the [Dcm](#) module shall obtain the status of the [DTC](#) by first calling [Dem_SelectDTC\(\)](#) with the following parameters:

- ClientId: Client Id for this [Dcm](#) instance (see [DcmDemClientRef](#))
- DTC: [DTC](#) as defined in [\[SWS_Dcm_00388\]](#)
- DTCOrigin: [DEM_DTC_ORIGIN_PRIMARY_MEMORY](#)

and then [Dem_GetStatusOfDTC\(\)](#) with the following parameter:

- ClientId: Client Id for this [Dcm](#) instance (see [DcmDemClientRef](#))

] ([RS_Diag_04058](#))

7.6.2.5.9 Subfunctions 0x0B, 0x0C, 0x0D and 0x0E

An external test tool can request the first occurred or most recent failed or confirmed [DTC](#) and associated status, by sending the [UDS](#) Service request 0x19 including one of the following sub-functions 0x0B, 0x0C, 0x0D, 0x0E

[SWS_Dcm_00392] [When sending a positive response to [UDS](#) Service 0x19 with subfunction 0x0B, 0x0C, 0x0D or 0x0E, the [Dcm](#) module shall use the data in the response message according to [Table 7.18](#).] ()

Parameter name	Value
DTCStatusAvailabilityMask	DTCStatusAvailabilityMask (see [SWS_Dcm_00007])
DTCAndStatusRecord	The DTC is obtained according to [SWS_Dcm_00466] , the StatusOfDtc is obtained according to [SWS_Dcm_00393]

Table 7.18: Subfunctions 0x0B, 0x0C, 0x0D and 0x0E response values

[SWS_Dcm_00393] [For the purpose of responding to [UDS](#) Service 0x19 with subfunctions 0x0B, 0x0C, 0x0D or 0x0E, the [Dcm](#) module shall obtain the StatusOfDtc by calling [Dem_GetStatusOfDTC\(\)](#) with the following parameter values:

- ClientId :Client Id for this [Dcm](#) instance (see [DcmDemClientRef](#))

- **DTC**: the [DTC](#) value as defined in [\[SWS_Dcm_00466\]](#)
- **DTCOrigin**: `DEM_DTC_ORIGIN_PRIMARY_MEMORY`

][\(RS_Diag_04058\)](#)

[SWS_Dcm_00766] [If the [Dcm](#) received `DEM_NO SUCH ELEMENT` by calling `Dem_GetDTCByOccurrenceTime` it shall reply with a positive response and empty `DTCAAndStatusRecord`.]()

7.6.2.5.10 Subfunction 0x14

An external test tool may request an ECU to report the `FaultDetectionCounter` for all [DTCs](#) with a "Prefailed" status, by sending a [UDS](#) Service request 0x19 with subfunction 0x14.

[SWS_Dcm_00464] [When sending a positive response to [UDS](#) Service 0x19 with subfunction 0x14, the [Dcm](#) module shall use the data in the response message according to Table 7.20.]()

Parameter name	Value
DTC	The DTC is obtained according from the call to <code>Dem_GetNextFilteredDTCAndFDC()</code>
<code>DTCFaultDetectionCounter</code>	The <code>DTCFaultDetectionCounter</code> is obtained according from the call to <code>Dem_GetNextFilteredDTCAndFDC()</code>

Table 7.20: Subfunction 0x14 response values

[SWS_Dcm_00465] [When responding to [UDS](#) Service 0x19 with subfunctions 0x14, the [Dcm](#) module shall obtain the DTCFaultCounter of every DTCs with status "prefailed" by repeatedly calling [Dem_GetNextFilteredDTCAndFDC\(\)](#) after having configured the filter with [Dem_SetDTCFilter\(\)](#) using the parameter values according to Table 7.21.]
 ([RS_Diag_04058](#))

Parameter name	Value
ClientId	Client Id for this Dcm instance (see DcmDemClientRef)
DTCStatusMask	0x00
DTCFormat	DEM_DTC_FORMAT_UDS
DTCOrigin	PRIMARY_MEMORY
FilterWithSeverity	NO
DTCSeverityMask	Not relevant
FilterForFaultDetectionCounter	YES

Table 7.21: Dem_GetNextFilteredDTCAndFDC() parameters values for subfunctions 0x14

[SWS_Dcm_00681] [The [Dcm](#) module shall obtain the number of records that will be found using [Dem_GetNextFilteredDTCAndFDC\(\)](#) by using [Dem_GetNumberOfFilteredDTC\(\)](#).]()

[SWS_Dcm_00519] [The calls to [Dem_SetDTCFilter\(\)](#) with parameter FilterForFault-DetectionCounter set to YES shall be done in the context of the [Dcm_MainFunction](#)]()

This allows the implementation to calculate the total size of the response before cycling through the DTCs.

When using paged buffer mechanism, in some case, it's possible that the number of [DTC](#) matching the filter change between the calculation of the total size, needed for the first page transmission, and the sending of the further pages. For this reason, the requirement [\[SWS_Dcm_00587\]](#) and [\[SWS_Dcm_00588\]](#) shall be considered for the implementation of this subservice.

[SWS_Dcm_01232] [If [Dem_GetNextFilteredDTCAndFDC\(\)](#) returns DEM_NO SUCH ELEMENT and at least one matching element could be retrieved before, the [Dcm](#) shall send a positive response including these data elements.]()

[SWS_Dcm_01233] [If [Dem_GetNextFilteredDTCAndFDC\(\)](#) returns DEM_NO SUCH ELEMENT and no matching element could be retrieved before, the [Dcm](#) shall send a positive response only for service and subservice.]()

7.6.2.5.11 Subfunction 0x42

[UDS](#) Service 0x19 with subfunction 0x42 requests WWH [OBD](#) [DTC](#)s matching a [DTC](#) status mask a severity mask record. The service request contains the following parameters:

- FunctionalGroupIdentifier
- DTCSeverityMask
- DTCStatusMask

[SWS_Dcm_01128] [The [Dcm](#) shall reject request messages for subFunction 0x42 with FunctionalGroupIdentifier unequal to 0x33 by returning [NRC](#) 0x31 (requestOutOfRange).]()

[SWS_Dcm_01129] [When sending a positive response to [UDS](#) Service 0x19 with subfunction 0x42, the [Dcm](#) module shall use the data in the response message according to Table 7.22.]()

Parameter name	Value
FunctionalGroupIdentifier	0x33
DTCStatusAvailabilityMask	Dem_GetDTCStatusAvailabilityMask (see [SWS_Dcm_00007])
DTCSeverityAvailabilityMask	Dem_GetDTCSeverityAvailabilityMask (see [SWS_Dcm_01127])
DTCFormatIdentifier	Dem_GetTranslationType (limited to values 0x04 and 0x02)
DTCAndSeverityRecord	As defined in [SWS_Dcm_01130]

Table 7.22: Subfunction 0x42 response values

[SWS_Dcm_01130] [When responding to [UDS](#) Service 0x19 with subfunction 0x42, the [Dcm](#) module shall obtain the DTCAndSeverityRecords by repeatedly calling [Dem_GetNextFilteredDTCAndSeverity\(\)](#) after having configured the filter with [Dem_SetDTCFilter\(\)](#) using the parameter values according to Table 7.23.]()

Parameter name	Value
ClientId	Client Id for this Dcm instance (see DcmDemClientRef)
DTCStatusMask	DTCStatusMask from request (see [SWS_Dcm_00700])
DTCFormat	DEM_DTC_FORMAT_UDS
DTCOrgin	DEM_DTC_ORIGIN_OBD_RELEVANT_MEMORY
FilterWithSeverity	YES
DTCSeverityMask	DTCSeverityMask from request
FilterForFaultDetectionCounter	NO

Table 7.23: Dem_GetNextFilteredDTCAndSeverity() parameters values for subfunctions 0x42

[SWS_Dcm_01131] [The return values of [Dem_GetNextFilteredDTCAndSeverity](#) shall be filled according to Table 7.24.]()

Parameter name	Value
DTCSeverity	DTCSeverity
DTCHighByte (MSB)	DTC (high byte)
DTCMiddleByte	DTC (middle byte)
DTCLowByte	DTC (low byte)
statusOfDTC	DTCStatus

Parameter name	Value
----------------	-------

Table 7.24: Dem_GetNextFilteredDTCAndSeverity return values

Note: The [Dcm](#) module can get an indication of the number of records that will be found using `Dem_GetNextFilteredDTCAndSeverity()` by using `Dem_GetNumberOfFilteredDTC()`.

7.6.2.5.12 Subfunction 0x55

With [UDS](#) Service 0x19 with sub-function 0x55 a client can retrieve a list of WWH-OBD [DTCs](#) with the "permanent [DTC](#)" status. The service request contains the following parameter:

- FunctionalGroupIdentifier

[SWS_Dcm_01343] [The [Dcm](#) shall only process request messages for sub-function 0x55 with FunctionalGroupIdentifier equal to 0x33.]()

[SWS_Dcm_01344] [The [Dcm](#) shall reject request messages for sub-function 0x55 with FunctionalGroupIdentifier unequal to 0x33 by returning [NRC](#) 0x31 (RequestOutOfRange).]()

[SWS_Dcm_01345] [When sending a positive response to [UDS](#) Service 0x19 with sub-function 0x55, the [Dcm](#) module shall use the following data in the response message according to Table 7.25.]()

Parameter name	Value
FunctionalGroupIdentifier	0x33
DTCStatusAvailabilityMask	Dem_GetDTCStatusAvailabilityMask (see [SWS_Dcm_00007])
DTCFormatIdentifier	Dem_GetTranslationType (limited to values 0x04 and 0x02)
DTCAndStatusRecord	As returned by <code>Dem_GetNextFilteredDTC()</code>

Table 7.25: Subfunction 0x55 response values

Note : When responding to [UDS](#) Service 0x19 with sub-function 0x55, the [Dcm](#) module could obtain the DTCAndStatusRecords by repeatedly calling `Dem_GetNextFilteredDTC()` after having configured the filter with `Dem_SetDTCFilter()` using the parameter values according to Table 7.26.

Parameter name	Value
ClientId	See <code>DcmDemClientRef</code>
DTCStatusMask	0x00
DTCFormat	DEM_DTC_FORMAT_UDS
DTCOrigin	DEM_DTC_ORIGIN_PERMANENT_MEMORY
FilterWithSeverity	NO
DTCSeverityMask	Not relevant
FilterForFaultDetectionCounter	NO

Parameter name	Value
----------------	-------

Table 7.26: Dem_GetNextFilteredDTCAndSeverity() parameters values for subfunctions 0x42

The [Dcm](#) module can get an indication of the number of records that will be found using [Dem_GetNextFilteredDTC\(\)](#) by using [Dem_GetNumberOfFilteredDTC\(\)](#).

[SWS_Dcm_01346] [When responding to [UDS](#) Service 0x19 with sub-function 0x55 and [Dem_GetTranslationType](#) returns a [Dem_DTCTranslationFormatType](#) different to 0x02 (DEM_DTC_TRANSLATION_SAEJ1939_73) or 0x04 (DEM_DTC_TRANSLATION_J2012DA_FORMAT_04), the [Dcm](#) module shall return [NRC](#) 0x10 (generalReject).]()

7.6.2.6 Service 0x22 - ReadDataByIdentifier

[SWS_Dcm_00253] [The [Dcm](#) module shall implement the [UDS](#) Service [ReadDataByIdentifier](#) (0x22).]()

[SWS_Dcm_01335] [On reception of the [UDS](#) Service [ReadDataByIdentifier](#) (0x22), if the number of requested [DID](#) exceeds the configured maximum number of data identifiers (refer to configuration parameter [DcmDspMaxDidToDelete](#)), the [Dcm](#) module shall send [NRC](#) 0x13 (Incorrect message length or invalid format).]()

With [UDS](#) Service 0x22, the tester can request the value of one or more [DID](#)s.

[SWS_Dcm_01548] Read UDS DID authentication check [On reception of the [UDS](#) Service [ReadDataByIdentifier](#) (0x22), the [Dcm](#) shall check if the access to all requested [DID](#)s outside the range 0xF200-0xF8FF is authenticated and read the data identifiers only if:

- a [DcmDspDidReadRole](#) is configured for that [DID](#) and the verification according to [\[SWS_Dcm_01522\]](#) was successful or
- the active white list on that connection has for each requested [DID](#) one entry with read access that matches that [DID](#).

] ([RS_Diag_04233](#))

[SWS_Dcm_01549] Read Dynamically defined DID authentication check [On reception of the [UDS](#) Service [ReadDataByIdentifier](#) (0x22), the [Dcm](#) shall check for all requested [DID](#)s inside the range 0xF200-0xF3FF if the content is based of [DID](#)s or parts of [DID](#)s that are authenticated and read the data identifiers only if:

- a [DcmDspDidReadRole](#) is configured for those [DID](#)s and the verification according to [\[SWS_Dcm_01522\]](#) was successful or
- the active white list on that connection has for each requested [DID](#) one entry with read access that matches those [DID](#)s.

](*RS_Diag_04233*)

According to [SWS_Dcm_01537] the authentication checks are only executed if DcmDspAuthentication is configured. In case of a failed authentication the NRC handling is according to [SWS_Dcm_01544] and [SWS_Dcm_01551] applies.

[SWS_Dcm_00438] [On reception of the [UDS](#) Service ReadDataByIdentifier (0x22), for every requested [DID](#) the [Dcm](#) module shall check if the [DID](#) is supported (see configuration parameter [DcmDspDid](#) and [DcmDspDidRange](#)) If none of the requested [DIDs](#) is supported, the [Dcm](#) module shall send [NRC](#) 0x31 (Request out of range).]()

[SWS_Dcm_00651] [On reception of the [UDS](#) Service ReadDataByIdentifier (0x22) with [DID](#) in the range 0xF200 to 0xF3FF, the [Dcm](#) module shall check if the [DID](#) can be dynamically defined (the [DcmDspDidInfo](#) it references has the [DcmDspDidDynamicallyDefined](#) set to true). If yes, if this [DID](#) has not been dynamically defined yet by calls to the DynamicallyDefineDataIdentifier (0x2C) service, i.e. it has no data sources defined, the [Dcm](#) module shall send [NRC](#) 0x31 (Requestout of range)]()

[SWS_Dcm_00652] [On reception of the [UDS](#) Service ReadDataByIdentifier (0x22) with [DID](#) in the range 0xF200 to 0xF3FF, if verification has been successfully done (see [SWS_Dcm_00651]) and the dynamic [DID](#) has been defined with a [DID](#) source (see [SWS_Dcm_00646]), the [Dcm](#) module shall use the configuration of this [DID](#) source to read the data.]()

[SWS_Dcm_00864] [On reception of the [UDS](#) Service ReadDataByIdentifier (0x22) with [DID](#) in the range 0xF200 to 0xF3FF, if verification has been successfully done (see [SWS_Dcm_00651]) and the dynamic [DID](#) has been defined with a [DID](#) source (see [SWS_Dcm_00646]), the [Dcm](#) module shall do the session, security and mode dependencies checks for all source [DIDs](#) in case the configuration parameter [DcmDspDDIDcheckPerSourceDID](#) is set to TRUE.]()

[SWS_Dcm_00865] [In case the configuration parameter [DcmDspDDIDcheckPerSourceDID](#) is set to FALSE, there is no session, security or mode dependencies check for the source [DIDs](#).]()

Note: In case there is a need to validate the session or security dependencies always, the DDDID should be cleared by any security and session transitions.

[SWS_Dcm_00653] [On reception of the [UDS](#) Service ReadDataByIdentifier (0x22) with [DID](#) in the range 0xF200 to 0xF3FF, if verification has been successfully done (see [SWS_Dcm_00651]) and the dynamic [DID](#) has been defined with a memory address (see [SWS_Dcm_00646]), the [Dcm](#) module shall use the callout [Dcm_ReadMemory](#) to read the data.]()

[SWS_Dcm_00561] [If a [DID](#) is set as unused ([DcmDspDidUsed](#) set to FALSE), the [Dcm](#) shall consider the [DID](#) as not supported (according to [SWS_Dcm_00438])]

[SWS_Dcm_00433] [On reception of the [UDS](#) Service ReadDataByIdentifier (0x22), for every requested [DID](#) the [Dcm](#) module shall check if the [DID](#) has a Read access configured (see configuration parameter [DcmDspDidRead](#) in [DcmDspDidInfo](#)). If none

of the **DID** has a Read access, the **Dcm** module shall send **NRC** 0x31 (Request out of range).]()

[SWS_Dcm_00434] [On reception of the **UDS** Service ReadDataByIdentifier (0x22), for every requested **DID** the **Dcm** module shall check if the **DID** can be read in the current session (see configuration parameter **DcmDspDidReadSessionRef**). If none of the **DID** can be read in the current session, the **Dcm** module shall send a **NRC** 0x31 (RequestOutOfRange).]()

[SWS_Dcm_00435] [On reception of the **UDS** Service ReadDataByIdentifier (0x22), for every requested **DID** the **Dcm** module shall check if the **DID** can be read in the current security level (see configuration parameter **DcmDspDidReadSecurityLevelRef**). If not, the **Dcm** module shall send **NRC** 0x33 (Security access denied).]()

[SWS_Dcm_00819] [On reception of the **UDS** Service ReadDataByIdentifier (0x22), for every requested **DID** the **Dcm** module shall check if the **DID** can be read in the current mode condition (according to the configuration parameter **DcmDspDidReadModeRuleRef**). If not, the **Dcm** module shall send the calculated negative response of the referenced **DcmModeRule**.]()

[SWS_Dcm_00439] [On reception of the **UDS** Service ReadDataByIdentifier (0x22), for every requested **DID** outside the **OBD** range (F400-F8FF), the **Dcm** module shall request the application if the **DID** can be read by calling the configured function (if parameter **DcmDspDataUsePort** set to **USE_DATA_SYNCH_FNC** or **USE_DATA_ASYNCH_FNC** or **USE_DATA_ASYNCH_FNC_ERROR**; see configuration parameter **DcmDspDataConditionCheckReadFnc**) on each data of the **DID** or call the associated **ConditionCheckRead** operation (if parameter **DcmDspDataUsePort** set to **USE_DATA_SYNCH_CLIENT_SERVER** or **USE_DATA_ASYNCH_CLIENT_SERVER** or **USE_DATA_ASYNCH_CLIENT_SERVER_ERROR**). If not (one function returns **E_NOT_OK**), the **Dcm** module shall send a negative response with **NRC** set to value from the parameter "ErrorCode" of **DcmDspDataConditionCheckReadFnc** function or **ConditionCheckRead** operation.]()

Note: This requirement exceeds the standard **ConditionCheck** behavior as described by ISO 14229-1 "NRC handling for ReadDataByIdentifier service", because it is not restricted to use **NRC** 0x22 in a negative response.

[SWS_Dcm_00440] [If the requested **DID** references other **DID** using **DcmDspDidRef**, the **Dcm** module shall process the verification and the reading of every referenced **DID** and concatenate the response data without any gaps based on the sequence in the configuration.]()

[SWS_Dcm_CONSTR_6023] **DcmDspDidRef** shall not reference the same **DID** reference twice [**DcmDspDid** container shall not include the same **DcmDspDidRef** parameters more than once.]()

[SWS_Dcm_CONSTR_6057] **Dependency for DcmDspDataEcuSignal** [**DcmDspDataEcuSignal** shall be only present if **DcmDspDataUsePort** is set to **USE_ECU_SIGNAL**.]()

[SWS_Dcm_CONSTR_6058] Dependency for [DcmDspDataEndianness](#) [In case [DcmDspDataEndianness](#) is not configured, the [DcmDspDataDefaultEndianness](#) shall be used instead.]()

[SWS_Dcm_CONSTR_6061] Dependency for [DcmDspDataReadDataLengthFnc](#) [[DcmDspDataReadDataLengthFnc](#) shall be only present if:

- [DcmDspDataUsePort](#) is set to [USE_DATA_SYNCH_FNC](#) or

[SWS_Dcm_00638] [To serialize the required AUTOSAR data types (signed- and unsigned integer) into the response message of [ReadDataByIdentifier](#) responses, the target endianness configured in [DcmDspDataEndianness](#) shall be considered for [DcmDspData](#) elements having [DcmDspDataUsePort](#) set to [USE_DATA_SENDER_RECEIVER](#), [USE_DATA_SENDER_RECEIVER_AS_SERVICE](#), [USE_ECU_SIGNAL](#).]()

[SWS_Dcm_CONSTR_6070] Dependency for [DcmDspDataEndianness](#) [In case [DcmDspDataEndianness](#) is not present, the [DcmDspDataDefaultEndianness](#) shall be used instead.]()

7.6.2.6.2 OBD DID

[SWS_Dcm_00481] [On reception of the [UDS](#) Service ReadDataByIdentifier (0x22), for every requested [DID](#) inside the [OBD](#) range (F400-F4FF), the [Dcm](#) module shall get the [DID](#) value as defined for [OBD](#) Service \$01 (see [\[SWS_Dcm_00407\]](#), [\[SWS_Dcm_00408\]](#), [\[SWS_Dcm_00943\]](#), [\[SWS_Dcm_00621\]](#), [\[SWS_Dcm_00622\]](#), [\[SWS_Dcm_00623\]](#), [\[SWS_Dcm_00944\]](#) and [\[SWS_Dcm_00718\]](#)), if [DcmDspEnableObdMirror](#) is set to true.]()

[SWS_Dcm_00482] [On reception of the [UDS](#) Service ReadDataByIdentifier (0x22), for every requested [DID](#) inside the [OBD](#) Monitor range (F600-F6FF), the [Dcm](#) module shall get the [DID](#) value as defined for [OBD](#) Service \$06 (see [\[SWS_Dcm_00957\]](#), [\[SWS_Dcm_00958\]](#), [\[SWS_Dcm_00945\]](#) and [\[SWS_Dcm_00956\]](#))]()

[SWS_Dcm_00483] [On reception of the [UDS](#) Service ReadDataByIdentifier (0x22), for every requested [DID](#) inside the [OBD](#) InfoType range (F800-F8FF), the [Dcm](#) module shall get the [DID](#) value as defined for [OBD](#) Service \$09 (see [\[SWS_Dcm_00422\]](#), [\[SWS_Dcm_00423\]](#) and [\[SWS_Dcm_00949\]](#) without including the number of data items within the response, if [DcmDspEnableObdMirror](#) is set to true.]()

[SWS_Dcm_01195] [If [DcmDspEnableObdMirror](#) is set to true, an explicitly configured [DID](#) inside the [OBD](#) range (F400-F4FF) and the [OBD](#) InfoType range (F800-F8FF) shall use the [UDS](#) interface.]()

[SWS_Dcm_01197] [If [DcmDspEnableObdMirror](#) is set to FALSE, all requests within the [OBD](#) [DID](#) range shall use the [UDS](#) interface.]()

If [DcmDspEnableObdMirror](#) is set to FALSE ([\[SWS_Dcm_01197\]](#)) or the [DID](#) is explicitly configured inside the [OBD](#) [PID](#) range (F400-F4FF) ([\[SWS_Dcm_01195\]](#)), the access to the [OBD](#) data shall be given in the following way:

[SWS_Dcm_01379] [On reception of an [UDS](#) Service ReadDataByIdentifier (0x22) request with only "availability OBDDatalIdentifier" as parameter, the [Dcm](#) shall respond with the corresponding supported (=configured) [DIDs](#) in the [OBD](#) range (F400-F4FF).]()

[SWS_Dcm_01380] [On reception of an [UDS](#) Service ReadDataByIdentifier (0x22) request with only OBDDatalIdentifier that are not "availability OBDDatalIdentifier", the [Dcm](#) shall obtain the current value of these OBDDatalIdentifier by invoking the configured [Xxx_ReadData\(\)](#) functions for every data of the OBDDatalIdentifier and shall return these values as response to Service 0x22.]()

[SWS_Dcm_01381] [On reception of an [UDS](#) Service ReadDataByIdentifier (0x22) request with a mixture of "availability OBDDatalIdentifier" and not "availability OBDDatalIdentifier", this request shall be ignored by the [Dcm](#).]()

[SWS_Dcm_01382] [If an OBDDatalIdentifier contains support information (presence of [DcmDspDidDataSupportInfo](#) container), the [Dcm](#) shall add the support information in the diagnostic response.]()

[SWS_Dcm_01383] [If an OBDDatalidentifier contains support information (presence of `DcmDspDidDataSupportInfo` container), the `Dcm` shall calculate the support information value according to the available data for this `DID`: for every `DcmDspData` container existing for this `DID`, the associated support information bits, referenced in `DcmDspDidDataSupportInfo`, shall be set to one.]()

[SWS_Dcm_01384] [When responding to `UDS` Service `ReadDataByIdentifier` (0x22) with OBDDatalidentifier, the `Dcm` shall put fill-bytes between `DcmDspData` in the OBDDatalidentifier whenever content bytes are missing, in order to fit to the `DID` size (see configuration parameter `DcmDspDidSize`).]()

[SWS_Dcm_01386] [To serialize the required AUTOSAR data types (signed and unsigned integer) into the response message of `ReadDataByIdentifier` (0x22) OBDDatalidentifier responses the target endianness configured in `DcmDspDataEndianness` shall be considered for `DcmDspData` elements having `DcmDspDataUsePort` set to `{USE_DATA_SENDER_RECEIVER, USE_DATA_SENDER_RECEIVER_AS_SERVICE, USE_ECU_SIGNAL}`. In case `DcmDspDataEndianness` is not present, the `DcmDspDataDefaultEndianness` shall be used instead.]()

If `DcmDspEnableObdMirror` is set to FALSE or the `DID` is explicitly configured inside the `OBD` InfoType range (F800-F8FF), the access to the `OBD` data shall be given in the following way:

[SWS_Dcm_01387] [On reception of an `UDS` Service `ReadDataByIdentifier` (0x22) request with one or more "availability OBDInfoTypeDatalidentifier" as parameter, the `Dcm` module shall respond with the corresponding supported (=configured) `DIDs` in the `OBD` range (F800-F8FF).]()

[SWS_Dcm_01388] [On reception of an `UDS` Service `ReadDataByIdentifier` (0x22) request with "availability OBDInfoTypeDatalidentifier" together with other OBDInfoTypeDatalidentifier as parameter, the `Dcm` module shall ignore the request.]()

[SWS_Dcm_01389] [On reception of an `UDS` Service `ReadDataByIdentifier` (0x22) request with an OBDInfoTypeDatalidentifier that is not an "availability OBDInfoTypeDatalidentifier", the `Dcm` module shall obtain the value of this OBDInfoTypeDatalidentifier by invoking all the configured `Xxx_ReadData()` function for every data of this OBDInfoTypeDatalidentifier and shall return the value as response to Service 0x22.]()

7.6.2.7 Service 0x24 - `ReadScalingDataByIdentifier`

[SWS_Dcm_00258] [The `Dcm` module shall implement the `UDS` Service `ReadScalingDataByIdentifier` (0x24).]()

To obtain scaling information, the tester can invoke `UDS` Service 0x24 with the 2-byte `DID` as parameter. The configuration of the `Dcm` contains for each configured DID:

- The 2-byte `DID` (see configuration parameter `DcmDspDidIdentifier`)
- For every data of the `DID` :

- The function `GetScalingInformation` (see configuration parameters `DcmDsp-DataGetScalingInfoFnc` and `DcmDspDataUsePort`)
- The length of the `ScalingInfo` returned by the `GetScalingInformation` function (see configuration parameter `DcmDspDataScalingInfoSize`)

[SWS_Dcm_00394] [On reception of a request for `UDS` Service `ReadScalingByIdentifier`, the `Dcm` module shall call every function `Xxx_GetScalingInformation()` configured for every data of the `DID` received in the request and return the data received in the response.]()

[SWS_Dcm_CONSTR_6060] **Dependency for `DcmDspDataGetScalingInfoFnc`**
`DcmDspDataGetScalingInfoFnc` shall be only present if:

- `DcmDspDataUsePort` is set to `USE_DATA_SYNCH_FNC` or
- `DcmDspDataUsePort` is set to `USE_DATA_ASYNCH_FNC` or
- `DcmDspDataUsePort` is set to `USE_DATA_ASYNCH_FNC_ERROR`

]()

7.6.2.8 Service 0x27 - SecurityAccess

[SWS_Dcm_00252] [The `Dcm` module shall implement the `UDS` Service `SecurityAccess` (0x27)] ([RS_Diag_04005](#))

The purpose of this service is to provide a means to access data and/or diagnostic services, which have restricted access for security, emissions, or safety reasons.

[SWS_Dcm_00321] [If the request length is correct, the `DSP` submodule shall check if the requested subfunction value (access type) is configured in the ECU (see configuration parameter `DcmDspSecurityLevel`). If the requested subfunction value is not configured, the `DSP` submodule shall trigger a negative response with `NRC 0x12` (SubFunction not supported).]()

[SWS_Dcm_00323] [If the requested subfunction value is configured and a service with subfunction type "requestSeed" (= odd value) has been received and if the requested access type is already active (see `Dcm_GetSecurityLevel`), the `DSP` submodule shall set the seed content to 0x00.]()

[SWS_Dcm_00324] [In the other case than the one described in [\[SWS_Dcm_00323\]](#) (access type is not active or "send key" request), if `DcmDspSecurityUsePort` is set to `USE_ASYNCH_CLIENT_SERVER`, the `DSP` submodule shall call the configured operation `Xxx_GetSeed()` (in case "request seed" is received) or `Xxx_CompareKey()` (in case "send key" is received).]()

[SWS_Dcm_00862] [On reception of the `UDS` Service `SecurityAccess` (0x27) with subfunction type "requestSeed" and if the requested access type is not already active, the `Dcm` module shall request a seed by calling the configured `Xxx_GetSeed()` function (if

the configuration parameter `DcmDspSecurityUsePort` is set to `USE_ASYNC_FNC`, refer to configuration parameter `DcmDspSecurityGetSeedFnc`).]()

Note : If the static seed mechanism is used, the processing needs to be done by the application implementing the `Xxx_GetSeed()` and `Xxx_CompareKey()` functions.

[SWS_Dcm_CONSTR_6077] Dependency for `DcmDspSecurityGetSeedFnc` [`DcmDspSecurityGetSeedFnc` shall be present only if `DcmDspSecurityUsePort` is set to `USE_ASYNC_FNC`.]()

[SWS_Dcm_00863] [On reception of the `UDS` Service `SecurityAccess` (0x27) with subfunction type "sendKey", if the requested access type is not already active and if the "request seed" for the related access type was executed successfully, the `Dcm` module shall request the result of a key comparison by calling the configured `Xxx_CompareKey()` function (if the configuration parameter `DcmDspSecurityUsePort` is set to `USE_ASYNC_FNC`, refer to configuration parameter `DcmDspSecurityCompareKeyFnc`).]()

[SWS_Dcm_CONSTR_6075] Dependency for `DcmDspSecurityCompareKeyFnc` [`DcmDspSecurityCompareKeyFnc` shall be configured only if `DcmDspSecurityUsePort` is set to `USE_ASYNC_FNC`.]()

The following list gives as an example, which errors can be detected by the security access service and stored in the error code information:

- `RequestSequenceError` (NRC 0x24), when invalid access type is send at "send key",
- `RequiredTimeDelayNotExpired` (NRC 0x37), when time delay is active (see configuration parameter `DcmDspSecurityDelayTime`),
- `ExceededNumberOfAttempts` (NRC 0x36), when number of attempts to get security access reaches or exceeds the configured limit (see configuration parameter `DcmDspSecurityNumAttDelay`), and
- `InvalidKey` (NRC 0x35), when invalid key is send at "send key".

[SWS_Dcm_00325] [If the operation `CompareKey()` returns `E_OK`, the `DSP` submodule shall set the new access type with `Ds1Internal_SetSecurityLevel()`(see the conversion formula given in `ECUC_Dcm_00754 DcmDspSecurityLevel`).]()

[SWS_Dcm_01397] [If `Xxx_CompareKey()` returns value `DCM_E_COMPARE_KEY_FAILED` and `DcmDspSecurityNumAttDelay` is configured, the `Dcm` shall increment the attempt counter of the security level for which the `sendKey` subfunction request failed.] (*RS_Diag_04005*)

[SWS_Dcm_00660] [If `Xxx_CompareKey()` returns value `DCM_E_COMPARE_KEY_FAILED` and if the number of failed attempts to enter the requested security level (AttemptCounter) is less than the value configured for the `DcmDspSecurityNumAttDelay` parameter of the requested security level, the `Dcm` module shall send a negative response with `NRC 0x35 (InvalidKey)` and shall not change the `Dcm` internal security level. Note: if `DcmDspSecurityNumAttDelay`

parameter is not configured, the number of failed attempts to enter the requested security level (AttemptCounter) is not considered.]()

[SWS_Dcm_01349] [If Xxx_CompareKey() returns value DCM_E_COMPARE_KEY_FAILED and if the number of failed attempts to enter the requested security level (AttemptCounter) is greater or equal than the value configured for the [DcmDspSecurityNumAttDelay](#) parameter of the requested security level, the [Dcm](#) module shall start the [SecurityDelayTimer](#) with the value configured in [DcmDspSecurityDelayTime](#) for the SecurityLevel which was requested in the failed request, send a negative response with NRC 0x36 (exceededNumberOfAttempts) and shall not change the Dcm internal security level.]()

[SWS_Dcm_01150] [If Xxx_CompareKey() returns value E_NOT_OK, the [Dcm](#) module shall send a negative response with [NRC](#) code equal to the ErrorCode parameter value and shall not increment the attempt counter or change the Dcm internal security level.]()

[SWS_Dcm_01350] [While the [SecurityDelayTimer](#) of SecurityLevel is not yet elapsed, the [Dcm](#) module shall send a negative response with NRC 0x37 (requiredTimeDelayNotExpired) on a [SecurityAccess](#) (0x27) requestSeed subfunction request for that Security Level.]()

[SWS_Dcm_00659] [If Xxx_GetSeed() returns value E_NOT_OK, the [Dcm](#) module shall send a negative response with [NRC](#) code equal to the ErrorCode parameter value.]()

7.6.2.9 Service 0x28 - CommunicationControl

[SWS_Dcm_00511] [The [Dcm](#) module shall implement the [CommunicationControl](#) (service 0x28) of the Unified Diagnostic Services.]()

[SWS_Dcm_00512] [On invocation of the sent confirmation function of the [UDS](#) Service [CommunicationControl](#) (0x28) from [DSD](#) with the subnet parameter of the request equal to 0x00, the [Dcm](#) shall do for each [NetworkHandle](#) (see [DcmDspAllComMChannelRef](#)) which is configured in [DcmDspComControlAllChannel](#):

1. trigger the mode switch [Dcm_CommunicationControl_<Network>](#) ModeDeclarationGroupPrototype to the mode corresponding the communicationType and controlType parameter from the [CommunicationControl](#) request.
2. call the Api [BswM_Dcm_CommunicationMode_CurrentState](#) with the parameters [NetworkHandleType](#) and [Dcm_CommunicationModeType](#) corresponding to the communicationType and controlType parameter from the [CommunicationControl](#) request (see [Dcm_CommunicationModeType](#) definition).

]()

[SWS_Dcm_00785] [On invocation of the sent confirmation function of the [UDS](#) Service [CommunicationControl](#) (0x28) from [DSD](#) with the subnet parameter of the request

equal to 0x0F(CommunicationControl on the network which request is received on), the [Dcm](#) shall do for the NetworkHandle (see [DcmDslProtocolComMChannelRef](#)) of the current received [DcmDslProtocolRxPduRef](#):

1. trigger the mode switch [Dcm_CommunicationControl_<Network> ModeDeclarationGroupPrototype](#) to the mode corresponding to the communicationType and controlType parameter from the CommunicationControl request.
2. call the Api [BswM_Dcm_CommunicationMode_CurrentState](#) with the parameters NetworkHandleType and [Dcm_CommunicationModeType](#) corresponding to the communicationType and controlType parameter from the CommunicationControl request (see [Dcm_CommunicationModeType](#) definition)

]()

[SWS_Dcm_00786] [On invocation of the sent confirmation function of the [UDS](#) Service [CommunicationControl](#) (0x28) from [DSD](#) with the subnet parameter of the request between 0x01 and 0x0E, the [Dcm](#) shall check if the received subnet parameter (see [DcmDspSubnetNumber](#)) is supported. In case it is not supported a [NegativeResponse](#) code 0x31 shall be sent. In case it is supported the [Dcm](#) shall do for the corresponding NetworkHandle (see [DcmDspSpecificComMChannelRef](#)) of the received subnet parameter (see [DcmDspSubnetNumber](#)):

1. trigger the mode switch [Dcm_CommunicationControl_<Network> ModeDeclarationGroupPrototype](#) to the mode corresponding the communicationType and controlType parameter from the CommunicationControl request.
2. call the Api [BswM_Dcm_CommunicationMode_CurrentState](#) the parameters NetworkHandleType and with [Dcm_CommunicationModeType](#) corresponding the communicationType and controlType parameter from the CommunicationControl request (see [Dcm_CommunicationModeType](#) definition)

]()

For some use-cases the [Dcm](#) may re-enable the CommunicationControl due to external changed mode conditions:

[SWS_Dcm_00753] [In case that the referenced ModeRule (see [ECUC_Dcm_00943](#)) is not fulfilled anymore for a NetworkHandle which is currently in a state other than [DCM_ENABLE_RX_TX_NORM_NM](#), the [Dcm](#) shall:

1. switch the mode group [Dcm_CommunicationControl_<Network> ModeDeclarationGroupPrototype](#) to [DCM_ENABLE_RX_TX_NORM_NM](#)
2. call [BswM_Dcm_CommunicationMode_CurrentState](#) with the parameters NetworkHandleType set to the corresponding NetworkHandle of the network and RequestedCommunicationMode set to [DCM_ENABLE_RX_TX_NORM_NM](#)

]()

[SWS_Dcm_00860] [For a NetworkHandle which is currently in a state other than [DCM_ENABLE_RX_TX_NORM_NM](#) if the [Dcm](#) is transitioning to default session or

upon any diagnostic session change where the new session does not support UDS Service CommunicationControl anymore, the [Dcm](#) shall:

1. switch the mode group `Dcm_CommunicationControl_<Network> ModeDeclarationGroupPrototype` to `DCM_ENABLE_RX_TX_NORM_NM`
2. call `BswM_Dcm_CommunicationMode_CurrentState` with the parameters `NetworkHandleType` set to the corresponding `NetworkHandle` of the network and `RequestedCommunicationMode` set to `DCM_ENABLE_RX_TX_NORM_NM`

]
()

Note: the NetworkHandles to be considered are all ComM channels which are referenced from either `DcmDspSpecificComMChannelRef`, `DcmDspAllComMChannelRef` or `DcmDspComControlSubNodeComMChannelRef`.

[SWS_Dcm_01077] [If a CommunicationControl Request with the sub-function "enableRxAndDisableTxWithEnhancedAddressInformation" is received, the [Dcm](#) shall check the "nodeIdentification-Number" listed as `DcmDspComControlSubNodeId` and for the referenced network (see `DcmDspComControlSubNodeComMChannelRef`), it shall do the followings:

1. trigger the mode switch `Dcm_CommunicationControl_<Network> ModeDeclarationGroupPrototype` to the mode corresponding the `communicationType` and `controlType` parameter from the CommunicationControl request.
2. call the Api `BswM_Dcm_CommunicationMode_CurrentState` with the parameters `NetworkHandleType` and `Dcm_CommunicationModeType` corresponding to the `communicationType` and `controlType` parameter from the CommunicationControl request (see `Dcm_CommunicationModeType` definition).

The analogue `controlType` `enableRxAndDisableTx` shall be used with the the following existing `Dcm_CommunicationModeType` values:

- `DCM_ENABLE_RX_DISABLE_TX_NORM`
- `DCM_ENABLE_RX_DISABLE_TX_NM`
- `DCM_ENABLE_RX_DISABLE_TX_NORM_NM`.

]
()

[SWS_Dcm_01078] [The [Dcm](#) shall trigger a negative response with `NRC 0x31` (`RequestOutOfRange`), if a CommunicationControl Request with the sub-function "enableRxAndDisableTxWithEnhancedAddressInformation" and a "nodeIdentification-Number" which is not listed as `DcmDspComControlSubNodeId` is received.]
()

[SWS_Dcm_01079] [If a CommunicationControl Request with the sub-function "enableRxAndTxWithEnhancedAddressInformation" is received, the [Dcm](#) shall check the "nodeIdentification-Number" listed as `DcmDspComControlSubNodeId` and for the referenced network (see `DcmDspComControlSubNodeComMChannelRef`) it shall do the followings:

1. trigger the mode switch `Dcm_CommunicationControl_<Network> ModeDeclarationGroupPrototype` to the mode corresponding the `communicationType` and `controlType` parameter from the `CommunicationControl` request.
2. call the Api `BswM_Dcm_CommunicationMode_CurrentState` with the parameters `NetworkHandleType` and `Dcm_CommunicationModeType` corresponding to the `communicationType` and `controlType` parameter from the `CommunicationControl` request (see `Dcm_CommunicationModeType` definition).

The analogue `controlType` `enableRxAndTx` shall be used with this the following existing `Dcm_CommunicationType` values :

- `DCM_ENABLE_RX_TX_NORM`
- `DCM_ENABLE_RX_TX_NM`
- `DCM_ENABLE_RX_TX_NORM_NM`.

]()

[SWS_Dcm_01080] [The `Dcm` shall trigger a negative response with [NRC](#) 0x31 (RequestOutOfRange), if a `CommunicationControl` Request with the sub-function "enableRxAndTxWithEnhancedAddressInformation" and a "nodeIdentification-Number" which is not listed as `DcmDspComControlSubNodeId` is received.]()

[SWS_Dcm_01081] [If `DcmDspComControlSubNodeUsed` is set to FALSE the sub-system (`DcmDspComControlSubNode`) is not available in this configuration.]()

[SWS_Dcm_01082] [If `DcmDspComControlSubNodeUsed` is set to TRUE the sub-system (`DcmDspComControlSubNode`) is available in this configuration.]()

Note : Condition checks (i.e. [NRC](#) 22 checks) on `CommunicationType` and `NetworkType` as well as check of `CommunicationType` support (i.e. [NRC](#) 0x31 check for `CommunicationType`) are not directly supported by the `Dcm`. Supplier/manufacturer notifications can be used.

7.6.2.10 Service 0x29 - Authentication

The UDS service Authentication (0x29) is used to provide dynamic means to control the access to diagnostic services. Execution of certain diagnostic services might have impact on safety, emissions or the vehicle. Controlling the access to diagnostic services via certificates provide means to control the access to diagnostic services after production. The access to these resources can be limited in time or bound to certain vehicles or ECUs only. AUTOSAR `Dcm` provides an out of the box solution for authenticated diagnostics with a given semantics of the UDS service Authentication. Even ISO 14229-1 [x] leaves more freedom, the `Dcm` will use only the functionality specified in this chapter. Further interpretations, certificate types or certificate content are out of scope of the AUTOSAR `Dcm` module. At the point of time this specification was developed, only the DIS (Draft International Standard) of ISO 14299-1:2018 is available.

Unless the official international standard ISO 14299-1:2018 is released, AUTOSAR will implement a solution based on this not public available draft.

[SWS_Dcm_01559] Support of UDS service authentication [The Dcm shall implement the UDS service Authentication (0x29) for sub-functions:

- deAuthenticate
- verifyCertificateUnidirectional
- verifyCertificateBidirectional
- proofOfOwnership
- authenticationConfiguration

]([RS_Diag_04230](#))

Note: AUTOSAR Dcm only implements the authentication via PKI certificated exchange. Authentication with challenge-response (ACR) is out of scope of AUTOSAR. If it is required it needs a full custom implementation using existing Dcm callouts for custom service processing.

[SWS_Dcm_01551] NRC Handling for UDS service authentication [The Dcm shall follow the NRC handling as defined for ISO 14229-1:2018 for UDS service authentication. This includes the NRC codes as well as the order of individual NRC checks.] ([RS_Diag_04230](#))

[SWS_Dcm_CONSTR_6091] Authentication configuration [The presence of a DcmDsdService with DcmDsdSidTabServiceId set to 0x29, requires a configured container DcmDspAuthentication on DcmDsp.]()

[SWS_Dcm_CONSTR_6092] Authentication per connection [The presence of a DcmDsdService with DcmDsdSidTabServiceId set to 0x29, requires a configured DcmDspAuthenticationConnection per configured connection DcmDslConnection.]()

[SWS_Dcm_CONSTR_6093] One authentication configuration per connection [Each DcmDspAuthenticationConnection shall refer a different DcmDslMainConnection by the reference in DcmDspAuthenticationConnectionMainConnectionRef.]()

The Dcm is using the Csm and KeyM for certificate management. Parsing the certificate is a potential time-consuming operation and needs to be executed asynchronous. There are opinions that security shall not reveal any cause of failed authentication and thus have no dedicated NRCs for different certificate failures. To respect this use case the Dcm provides a general security NRC handling.

[SWS_Dcm_01560] Use of generic NRC for invalid certificate or content [If the mode referenced by DcmDspAuthenticationGeneralNRCModeRuleRef evaluates to true, the Dcm shall send the NRC code given in DcmDspAuthenticationGeneralNRC instead of the specific NRC codes in all situation where a Certificate verification failed - NRC is returned.] ([RS_Diag_04230](#))

[SWS_Dcm_CONSTR_6094] Generic NRC configuration requirements [If DcmDspAuthenticationGeneralNRCModeRuleRef is configured the parameter DcmDspAuthenticationGeneralNRC shall also be configured.] ([RS_Diag_04230](#))

7.6.2.10.1 De-authentication

The de-authenticate sub-function shall be always available if service 0x29 is used. This service set the authentication state to deauthenticated for the diagnostic connection the request was received on.

[SWS_Dcm_CONSTR_6095] [The presence of a DcmDsdService with DcmDsd-SidTabServiceId set to 0x29, requires a DcmDsdSubService on this DcmDsdService with DcmDsdSubServiceId set to deAuthenticate.]()

[SWS_Dcm_01561] Deauthentication by diagnostic service request [On reception of an Authentication (0x29) service with sub-function equal to de-authenticate, the Dcm shall set the authentication state to deauthenticated on the connection the Dcm has received that request.] ([RS_Diag_04230](#))

[SWS_Dcm_01565] [On reception of an Authentication (0x29) service with sub-function equal to de-Authenticate, the Dcm shall reply with a positive response having the authenticationReturnParameter set to DeAuthentication successful.] ([RS_Diag_04230](#))

7.6.2.10.2 Verify Certificates

[SWS_Dcm_01459] Supported communicationConfiguration [On reception of an Authentication (0x29) service with sub-function equal to verifyCertificateUnidirectional or verifyCertificateBidirectional, the [Dcm](#) shall reply with an [NRC](#) 0x31 (requestOutOfRange) if the communicationConfiguration (COCO) parameter has a value different than 0x00.] ([RS_Diag_04230](#))

The support of a COCO with constant value of 0x00 implies that no session key is supported by the [Dcm](#). Upon receiving an authentication request with sub-function verifyCertificateUniDirectional and the communicationConfiguration (COCO) set to 0x00, the [Dcm](#) starts to verify the certificate. This service is implemented on BSW level by intention, to reduce the possible dialects of service 0x29 to what is natively supported by AUTOSAR. The Csm [16] and KeyM [17] modules allow to use different cryptographic methods. It is part of the [Dcm](#) strategy to explicitly require that certificates and all kind of access to information inside are handled by the Csm and its configuration. This allows to map different kind of certificates with different levels of security to the [Dcm](#), thus abstracting the certificate complexity from [Dcm](#).

[SWS_Dcm_01460] Verify verifyCertificateUnidirectional message length check [On reception of an Authentication (0x29) service with sub-function equal to verifyCertificateUnidirectional, the [Dcm](#) shall verify that the message length fits to the size given

in the parameters lengthOfCertificateClient and return a [NRC](#) 0x13 if the size does not match.] [\(RS_Diag_04230\)](#)

[SWS_Dcm_01461] Verify verifyCertificateBidirectional message length check [On reception of an Authentication (0x29) service with sub-function equal to verifyCertificateBidirectional, the [Dcm](#) shall verify that the message length fits to the size given in the parameters lengthOfCertificateClient and lengthOfChallengeClient and return a [NRC](#) 0x13 if the size does not match. The [Dcm](#) uses the lengthOfCertificateClient as offset to calculate the position of lengthOfChallengeClient.] [\(RS_Diag_04230\)](#)

[SWS_Dcm_01462] Required configuration for bidirectional authentication [If the sub-function verifyCertificateBidirectional is configured in the DsdServiceSubFunction for 0x29, the configuration parameters [DcmDspAuthenticationECUCertificateRef](#) and [DcmDspAuthenticationECUCertificateKeyElementRef](#) are required.] ()

[SWS_Dcm_01579] Mandatory certificate data [On reception of an Authentication (0x29) service with sub-function equal to verifyCertificateUnidirectional or verifyCertificateBidirectional and a lengthOfCertificateClient equal to zero, the [Dcm](#) shall respond with [NRC](#) 0x13 (incorrectMessageLengthOrInvalidFormat)..] [\(RS_Diag_04230\)](#)

Store certificate in Csm

[SWS_Dcm_01463] Certificate validation [On reception of an Authentication (0x29) service with sub-function equal to verifyCertificateUnidirectional or verifyCertificateBidirectional, the [Dcm](#) shall use the KeyM API KeyM_SetCertificate to store the client certificate from the service request within the KeyM module. The following parameter values shall be used:

- CertificateId = [DcmDspAuthenticationConnectionCertificateRef](#) -> KeyMCertificate.KeyMCertificateId
- certificateDataPtr.certData = Pointer to certificateClient from Request
- certificateDataPtr.certDataLength = lengthOfCertificateClient from Request

] [\(RS_Diag_04230\)](#)

Diagnostic certificate configuration is a task that is mainly executed in the Csm and KeyM modules. The [Dcm](#) provides an abstraction from these modules and only keeps symbolic references to containers that keep the information. Please take attention while configuring the Csm and KeyM 'in spirit of [Dcm](#) certificates'.

[SWS_Dcm_01464] Invalid certificate size failure [If the API KeyM_SetCertificate returns KEYM_E_SIZE_MISMATCH, the [Dcm](#) shall return the [NRC](#) 0x13 (incorrectMessageLengthOrInvalidFormat).] [\(RS_Diag_04230\)](#)

[SWS_Dcm_01465] Behavior on busy crypto operation [If any of the Csm or KeyM APIs called by the [Dcm](#) is returning CRYPTO_E_BUSY or KEYM_E_BUSY, the [Dcm](#) shall return the [NRC](#) 0x21 (busyRepeat).] [\(RS_Diag_04230\)](#)

[SWS_Dcm_01466] Csm APIs returning failure code behavior [Throughout this chapter the Csm or KeyM are used to process the authentication requests. These APIs have return values for failures. Unless there is no dedicated requirement for a given return value and if the return value is different to E_OK, the [Dcm](#) shall return a [NRC](#) 0x10 'GeneralReject'.] ([RS_Diag_04230](#))

The cryptographic operations have potential long execution times and are called asynchronously.

[SWS_Dcm_01467] Asynchronous certificate operation handling [For all asynchronous Csm or KeyM operations, the [Dcm](#) shall wait until the callback has been called, indicating a successful job termination. If the result (e.g. KeyM_ResultType) is E_OK, the [Dcm](#) shall continue to process the 0x29 request, if the result is different to E_OK, the [Dcm](#) shall skip the further processing and return a negative response with [NRC](#) 'GeneralReject'.] ([RS_Diag_04230](#))

Parse and Verify certificate in Csm

[SWS_Dcm_01468] Verifying client certificate [After the [Dcm](#) has set the certificate according to [\[SWS_Dcm_01463\]](#), the [Dcm](#) shall verify the certificate by calling KeyM_VerifyCertificate with the following parameters:

- CertificateId = [DcmDspAuthenticationConnectionCertificateRef](#) -> KeyMMCertificate.KeyMCertificateId

] ([RS_Diag_04230](#))

[SWS_Dcm_01469] Behavior on failed certificate verification [After the [Dcm](#) has verified a certificate and KeyM_ReturnType is set to KEYM_E_SIGNATURE_FAIL, the [Dcm](#) shall send a negative response with [NRC](#) set to 'Certificate verification failed - Invalid Signature'.] ([RS_Diag_04230](#))

[SWS_Dcm_01470] Check certificate chain of trust [If the operation started in [\[SWS_Dcm_01468\]](#) returns a result of KEYM_E_INVALID_CHAIN_OF_TRUST, the [Dcm](#) shall refuse the client certificate and return a negative response with [NRC](#) 'Certificate verification failed - Invalid Chain of Trust'.] ([RS_Diag_04235](#))

[SWS_Dcm_01471] Check certificate type [If the operation started in [\[SWS_Dcm_01468\]](#) returns a result of KEYM_E_INVALID_TYPE, the [Dcm](#) shall refuse the client certificate and return a negative response with [NRC](#) 'Certificate verification failed - Invalid Type'.] ([RS_Diag_04235](#))

[SWS_Dcm_01472] Check certificate format [If the operation started in [\[SWS_Dcm_01468\]](#) returns a result of KEYM_E_INVALID_FORMAT, the [Dcm](#) shall refuse the client certificate and return a negative response with [NRC](#) 'Certificate verification failed - Invalid Format'.] ([RS_Diag_04235](#))

[SWS_Dcm_01473] Check certificate format [If the operation started in [\[SWS_Dcm_01468\]](#) returns a result of KEYM_E_INVALID_CONTENT, the [Dcm](#) shall refuse the client certificate and return a negative response with [NRC](#) 'Certificate verification failed - Invalid Scope'.] ([RS_Diag_04235](#))

Note: While most of the KeyM return values can be mapped 1:1 on [UDS NRC](#) values, this does not apply for KEYM_E_INVALID_CONTENT. An invalid content from KeyM indicates that a key element verification has failed. A failed key element verification means that the certificate itself is valid, but the KeyM refuses the certificate as the data does not fit to the server's required value. In [UDS](#) this is expressed by 'Certificate verification failed - Invalid Scope'. As result invalid content from KeyM will trigger the [NRC](#) invalid scope.

[SWS_Dcm_01475] Check certificate format [If the operation started in [\[SWS_Dcm_01468\]](#) returns a result of KEYM_E_CERTIFICATE_REVOKED, the [Dcm](#) shall refuse the client certificate and return a negative response with [NRC](#) 'Certificate verification failed - Invalid Certificate (revoked)'.] ([RS_Diag_04235](#))

[SWS_Dcm_01476] Check certificate valid until [If the operation started in [\[SWS_Dcm_01468\]](#) returns a result of KEYM_E_VALIDITY_PERIOD_FAIL, the [Dcm](#) shall refuse the client certificate and return a negative response with [NRC](#) 'Certificate verification failed - Invalid Time Period'.] ([RS_Diag_04235](#))

Verify target identification

Certificates can have target constraints, such as limiting a certificate to a certain VIN or ECU version number. This is realized by target identification blocks as elements of the certificate. A target identification block is evaluated at runtime, only if all items are fulfilled, the certificate is accepted by the [Dcm](#). Each target identification element is mapped to a compare value of a [DcmModeCondition](#). A [DcmModeRule](#) combines these conditions to one term that evaluates to true or false.

[SWS_Dcm_01490] Certificate acceptance by target identification [The [Dcm](#) shall only accept certificates if the configured mode rule referenced by [DcmDspAuthenticationTargetIdentificationModeRuleRef](#) is evaluated to true.] ([RS_Diag_04236](#))

[SWS_Dcm_01491] Behavior on failed target identification [If the configured mode rule referenced by [DcmDspAuthenticationTargetIdentificationModeRuleRef](#) is evaluated to fail, the [Dcm](#) shall refuse the certificate and send a negative response with [NRC](#) 'Certificate verification failed - Invalid Scope'.] ([RS_Diag_04236](#))

[SWS_Dcm_01492] Invalid target identification block data [If the [Dcm](#) fails to match the target identification block data from [DcmModeConditionConnectionCertificateCompareElementRef](#) as valid (e.g. number of required bytes do not match), the [Dcm](#) shall send a negative response with [NRC](#) 'Certificate verification failed - Invalid Format'.] ([RS_Diag_04236](#))

Providing the server challenge

The [Dcm](#) uses the [Csm](#) to create a server challenge by returning a random value.

[SWS_Dcm_01588] Length of server challenge [The [Dcm](#) shall create a server challenge with the length configured in [DcmDspAuthenticationEcuChallengeLength](#).] ([RS_Diag_04230](#))

[SWS_Dcm_01493] Creating the server challenge [After successfully validating the client certificate in [\[SWS_Dcm_01463\]](#), the [Dcm](#) shall create a server challenge by using the Csm in the following sequence:

- 1) Call of Csm_RandomGenerate with parameters
 - a. jobId : [DcmDspAuthenticationRandomJobRef](#) -> CsmJobId
- 2) Wait until the asynchronous job has terminated according to [\[SWS_Dcm_01467\]](#).
][\(RS_Diag_04230\)](#)

The API Csm_RandomGenerate requires an initialised random generator. The initialization of the random generator is a task of the system (integrator).

[SWS_Dcm_01503] Sending positive response on verifyCertificateUniDirectional

[If the [Dcm](#) has successfully calculated server challenge the [Dcm](#) shall send a positive response for the verifyCertificateUniDirectional request with the following parameter values:

authenticationReturnParameter : 'Certificate verified, Ownership verification necessary'
lengthOfChallengeServer: length of the challenge generated in [\[SWS_Dcm_01493\]](#)
challengeServer: challenge generated in [\[SWS_Dcm_01493\]](#)
lengthOfEphemeralPublicKeyServer: 0x0000
][\(RS_Diag_04230\)](#)

Processing a diagnostic request verifyCertificateBidirectional will furthermore require the [Dcm](#) to send a server certificate and signing the client challenge. Therefore, the following steps are done additionally for verifyCertificateBidirectional.

[SWS_Dcm_01504] Signing client challenge [On reception of an Authentication (0x29) service with sub-function equal to verifyCertificateBidirectional, the [Dcm](#) shall sign the received client challenge by calling Csm_SignatureGenerate with the following parameter values:

jobId: [DcmDspAuthenticationClientChallengeSignJobRef](#) -> CsmJobId
mode: CRYPTO_OPERATIONMODE_SINGLECALL
dataPtr: Pointer to challengeClient in request
dataLength: lengthOfChallengeClient from request
resultPtr: [Dcm](#) sided buffer to store the proofOfOwnershipServer
resultLengthPtr: Response data for lengthOfProofOfOwnershipServer
][\(RS_Diag_04230\)](#)

[SWS_Dcm_CONSTR_6096] Require asynchronous client challenge signing [[DcmDspAuthenticationClientChallengeSignJobRef](#) shall be only accepted if the referenced CsmJob itself:

- has a CsmProcessingMode set to CRYPTO_PROCESSING_ASYNC
- references a CsmPrimitive with an aggregated CsmSignatureGenerate.

][\(RS_Diag_04230\)](#)

[SWS_Dcm_01506] Providing the server certificate [On reception of an Authentication (0x29) service with sub-function equal to verifyCertificateBidirectional,

the `Dcm` shall provide the server certificate in the response. The `Dcm` shall call `KeyM_GetCertificate` with the following parameters:

`certId: DcmDspAuthenticationECUCertificateRef/KeyMCertificateId`

`certificateDataPtr: Dcm` implementation specific

](*RS_Diag_04230*)

[SWS_Dcm_01507] Server certificate size check [If the API `Csm_GetKeyElement` returns `CRYPTO_E_SMALL_BUFFER`, the `Dcm` shall return `NRC 0x14 (responseToo-Long.)`.](*RS_Diag_04230*)

[SWS_Dcm_01508] Sending positive response on verifyCertificateBidirectional

[If the `Dcm` has successfully calculated server challenge, the server challenge and the server certificate, the `Dcm` shall send a positive response for the `verifyCertificateBidirectional` request with the following parameter values:

`authenticationReturnParameter: 'Certificate verified, Ownership verification necessary'`

`lengthOfChallengeServer: length of the challenge generated in [SWS_Dcm_01493]`

`challengeServer: challenge generated in [SWS_Dcm_01493]`

`lengthOfCertificateServer: length of the certificate provided in [SWS_Dcm_01506]`

`certificateServer: certificate provided in [SWS_Dcm_01506]`

`lengthOfProofOfOwnershipServer: length of proof-of-ownership server created in [SWS_Dcm_01504]`

`proofOfOwnershipServer: proof-of-ownership server created in [SWS_Dcm_01504]`

`lengthOfEphemeralPublicKeyServer: 0x0000`

](*RS_Diag_04230*)

7.6.2.10.3 Proof of ownership client

[SWS_Dcm_01509] Sequence check [On reception of an `Authentication` (0x29) service with sub-function equal to `proofOfOwnership` and if on this connection the most recent processed `verifyCertificateUnidirectional` or `verifyCertificateBidirectional` service failed or no such sub-function was processed yet, the `Dcm` shall send the negative response `'requestSequenceError'`. The connection shall remain in de-authenticated state.](*RS_Diag_04230*)

[SWS_Dcm_01510] Proof of ownership message length check [On reception of an `Authentication` (0x29) service with sub-function equal to `proofOfOwnership`, the `Dcm` shall verify that the message length fits to the size given in the parameters `lengthOfProofOfOwnershipClient` and `lengthOfEphemeralPublicKeyClient` and return a `NRC 0x13` if the size does not match.](*RS_Diag_04230*)

[SWS_Dcm_01511] Client proof of ownership verification [On reception of an `Authentication` (0x29) service with sub-function equal to `proofOfOwnership`, the `Dcm` shall verify the client's proof of ownership data provide in the request by calling `Csm_SignatureVerify` with the following in-parameters:

`jobId: DcmDspAuthenticationVerifyProofOfOwnershipClientJobRef -> CsmJob.CsmJobId`

mode: set to CRYPTO_OPERATIONMODE_SINGLECALL

dataPtr: challenge generated [[SWS_Dcm_01493](#)]

dataLength: length of the challenge generated in [[SWS_Dcm_01493](#)]

signaturePtr: proofOfOwnerShipClient from request

signatureLength: lengthOfProofOfOwnerShipClient from request

][\(RS_Diag_04230\)](#)

[SWS_Dcm_CONSTR_6098] Require asynchronous signature verification [
DcmDspAuthenticationVerifyProofOfOwnerShipClientJobRef is only valid
if the referenced CsmJob itself:

- has a CsmProcessingMode set to CRYPTO_PROCESSING_ASYNC
- references a CsmPrimitive with an aggregated CsmSignatureVerify.

][\(\)](#)

[SWS_Dcm_01512] Failed ownership verification [
If the result of
Csm_SignatureVerify from [[SWS_Dcm_01511](#)] is Crypto_VerifyResultType equal
to CRYPTO_E_VER_NOT_OK, the Dcm shall send a negative response with NRC
'Ownership verification failed'.][\(RS_Diag_04230\)](#)

[SWS_Dcm_01513] SessionKey support [
Upon sending a positive response for an
authentication request with sub-function equal to proofOfOwnership, the Dcm shall:

- set all bytes of lengthOfSessionKeyInfo to 0x00
- omit the sessionKeyInfo

][\(RS_Diag_04230\)](#)

Set current role

[SWS_Dcm_01514] Update the current role [
If the proof of ownership verification
in [[SWS_Dcm_01511](#)] was successful and resulted in CRYPTO_E_VER_OK, the Dcm
shall use the value read from the certificate extension DcmDspAuthentication-
RoleElementRef as new role for the current authenticated state.][\(RS_Diag_04233\)](#)

[SWS_Dcm_01515] Role size check [
If the size of the read role information in
[[SWS_Dcm_01514](#)] is different than the size in DcmDspAuthenticationRoleSize,
the Dcm shall send a negative response with NRC 'Certificate verification failed - Invalid
Content'.][\(RS_Diag_04230\)](#)

Set white list

[SWS_Dcm_01516] Update the current whitelist [
If the proof of ownership verification
in [[SWS_Dcm_01511](#)] was successful and resulted in CRYPTO_E_VER_OK, the
Dcm shall use the white list read from the certificate according to [[SWS_Dcm_01517](#)]
as new white list for the current authenticated state.][\(RS_Diag_04232\)](#)

[SWS_Dcm_01517] White list access [To read the white list from a certificate, the `Dcm` shall read all child elements from the referenced `DcmDspAuthenticationWhiteListServicesElementRef`, `DcmDspAuthenticationWhiteListDIDEElementRef`, `DcmDspAuthenticationWhiteListRIDEElementRef` and `DcmDspAuthenticationWhiteListMemorySelectionElementRef` certificate data, by repeating calling the sequence of `KeyM_CertElementGetFirst` and `KeyM_CertElementGetNext` until no further child element is available. The `Dcm` shall use the following in parameter values:

```
certId: DcmDspAuthenticationConnectionCertificateRef -> KeyMCertificate.KeyMCertificateId  
certElementId: DcmDspAuthenticationWhiteListMemorySelectionElementRef -> KeyMCertificateElement.KeyMCertificateElementId  
]()
```

[SWS_Dcm_01518] White list size check [If the size of the read white list information in [SWS_Dcm_01516] is larger than the size in `DcmDspAuthenticationWhiteListMemorySelectionMaxSize`, the `Dcm` shall send a negative response with `NRC` 'Certificate verification failed - Invalid Content'.] (*RS_Diag_04230*)

[SWS_Dcm_CONSTR_6087] Required size for white lists [If any of the optional `DcmDspAuthenticationWhiteListMemorySelectionElementRef` are configured, the corresponding `DcmDspAuthenticationWhiteListMemorySelectionMaxSize` shall be configured for that white list.] (*RS_Diag_04232*)

7.6.2.10.4 Definition and verification of roles

The roles transmitted inside the certificates are used to assign a tester on one connection one or more roles. A single role itself is presented by a certain bit within the bitfield representation of the role. Within the `Dcm` there is static role assignment to each diagnostic service. A service can be executed if at least one role (bit) assigned to a service matches a role (bit) in the certificate.

[SWS_Dcm_CONSTR_6088] Supported role sizes [The parameter `DcmDspAuthenticationRoleSize` defines the size in bytes used in both, certificates and ECU internal static role configuration. All role parameters (e.g. `DcmDspServiceRole`) shall have values that would fit in the amount of bytes given by `DcmDspAuthenticationRoleSize`.] (*RS_Diag_04233*)

[SWS_Dcm_01521] Integer interpretation of roles in certificates [The `Dcm` shall interpret all configured role integer values in the little endian format.] (*RS_Diag_04234*)

[SWS_Dcm_01522] Role verification [Upon each role verification, the `Dcm` shall make a bitwise 'and' operation on the role provided in the certificate for that connection and the role assigned to the service. If the result is greater than 0, the `Dcm` shall treat the service as allowed to be executed.] (*RS_Diag_04233; RS_Diag_04234*)

[SWS_Dcm_01523] Failed role verification [Upon each role verification, the [Dcm](#) shall make a bitwise 'and' operation on the role provided in the certificate for that connection and the role assigned to the service. If the result is equal to 0, the [Dcm](#) shall stop the processing of that service and send a negative response 'authenticationRequired'.] ([RS_Diag_04233](#); [RS_Diag_04234](#))

An example of roles in certificates and services with assigned certificates is given in Figure 7.10. The provided certificate uses 1 byte for roles, with 5 role definitions in. The certificate will grant the tester rights for the roles 'AfterSales' and 'ExtendedUser'. With that certificate, the tester can execute the services that have the corresponding permissions to be executed in that roles. In that example, the service 0x28 and 0x11 01 are both allowed to be executed. The routine with identifier 0x5678 is only allowed to be executed in role 'production', the [Dcm](#) will deny the execution with [NRC](#) 'authenticationRequired'.

Bit	7	6	5	4	3	2	1	0
Certificate	0	0	1	1	0	0	0	0
Service List								
Service 0x28	0	0	1	1	0	0	0	0
Service 0x11 01	0	0	1	0	0	0	0	0
RID 0x5678	0	1	0	0	0	0	0	0

Figure 7.10: Example for roles

7.6.2.10.5 Definition and verification of white lists

Besides the use of roles, the certificates can get extended with optional white lists for service execution. This allows the issuer of the certificate to extend the range of allowed services without updating the access lists in the ECU.

The white list is build out of the following elements:

- List of allowed services, 1-4 byte each
- List of allowed data identifiers ([DID](#)) and access information, 3 byte each
- List of allowed routine identifiers ([RID](#)) and access information, 3 byte each
- List of allowed user defined fault memories, 1 byte each

Parsing and access to the different elements of the white lists is done by invoking [KeyM_CertElementGetFirst](#) and [KeyM_CertElementGetNext](#) according to [\[SWS_Dcm_01517\]](#).

[SWS_Dcm_01524] White list for services definition [The white list for services is a set of values, each consisting of up to 4 bytes. Each value itself contains the first bytes of a diagnostic service that is allowed be executed.] ([RS_Diag_04233](#); [RS_Diag_04234](#))

Example:

In the following example, a white list section within a certificate is shown. It contains 5 additional services that can be executed:

```
1 ...
2 SEQUENCE (1 elem)
3   SEQUENCE (2 elem)
4     OBJECT IDENTIFIER 3.9.3.345.3.1.3453.24.3.9.355.73
5     SET (6 elem)
6       OCTET STRING (1 byte) 85
7       OCTET STRING (2 byte) 1101
8       OCTET STRING (3 byte) 22123A
9       OCTET STRING (3 byte) 2E123A
10      OCTET STRING (4 byte) 310113F4
11 SEQUENCE (3 elem) ....
```

This will allow the Dcm to execute:

- Service 0x85 (with any sub-subfunction and DTCSettingControlOptionRecord byte)
- Service 0x11 01
- Read and WriteDataByIdentifier for [DID](#) 0x123A
- Routine Start for [RID](#) 0x13F4

Checks for white lists for services are all done at [DSD](#) level. The [Dcm](#) checks if the first bytes of a received diagnostic request match the values allowed by the white list. If a white list entry exists where all bytes are matching the first bytes of the request, the service is granted access.

For all other white lists, the [Dcm](#) performs the checks at [DSP](#) level in the corresponding service processors.

Please note that it is possible to allow a [DID](#) execution in two places in the white list: 1) as 3 byte service and 2) as [DID](#) in the [DID](#) list. The difference is that the service checks only the first 3 bytes of the [PDU](#) and will not detect the [DID](#) being used in multiple [DID](#) or dynamically defined [DID](#) requests, while the [DID](#) list element is verified in all services requesting the [DID](#).

[SWS_Dcm_01525] White list definition for [DIDs](#) [The white list for [DIDs](#) defines the set of data identifiers that are allowed to be read, written and controlled. Each entry shall contain in the first two bytes the [DID](#) number and in the third byte the following access definitions:]

- Bit 0: Read access
- Bit1: Write access
- Bit2: Control access (by `InputOutputControlByIdentifier`)

A bit value of 0 means that the operation is forbidden, a bit value of 1 means that the operation is allowed. All not used bits (3-7) shall be set to zero.

`DID` numbers are always in big endian format (MSB first).] ([RS_Diag_04233](#); [RS_Diag_04234](#))

Example:

<code>DID</code> access record	Grants access to
0x1A90 0x01	All read data by identifier operations for <code>DID</code> 0x1A90
0x314F 0x05	All read data by identifier and IOcontrol operations for <code>DID</code> 0x314F

`DID` read operations are performed from various `UDS` services. `Dcm` checks on each `DID` read the access to that `DID`.

[SWS_Dcm_01526] White list definition for `RIDs` [The white list for `RIDs` defines the set of routine identifiers that have access to the sub-functions `startRoutine`, `stopRoutine` and `requestRoutineResult`. Each entry shall contain in the first two bytes the `RID` number and in the third byte the following access definitions:

- Bit 0: Access to sub-function 'startRoutine'
- Bit1: Access to sub-function 'stopRoutine'
- Bit2: Access to sub-function 'requestRoutineResult'

A bit value of 0 means that the sub-function is forbidden, a bit value of 1 means that the sub-function is allowed. All not used bits (3-7) shall be set to zero.

`RID` numbers are always in big endian format (MSB first).] ([RS_Diag_04233](#); [RS_Diag_04234](#))

Example:

<code>RID</code> access record	Grants access to
0x0240 0x01	<code>StartRoutine</code> is allowed for <code>RID</code> 0x0240
0x028A 0x07	All routine sub-functions are allowed for <code>RID</code> 0x28A

[SWS_Dcm_01527] White list definition for `MemorySelection` [The white list memory selection is used for the `UDS` service 0x19 with sub-functions 0x17, 0x18 and 0x19. The value in the white list defines the accepted parameter values for `MemorySelection` in the `UDS` request.] ([RS_Diag_04233](#); [RS_Diag_04234](#))

Transition into authenticated session

[SWS_Dcm_01528] Transition into authenticated state [If the proof of ownership verification in [SWS_Dcm_01511] was successful and resulted in CRYPTO_E_VER_OK and after the role and white list setting was done, the Dcm shall set the DcmAuthenticationState_{Channel} on that connection into DCM_AUTHENTICATED.] (RS_Diag_04230)

[SWS_Dcm_01529] Successful ownership verification [If the result of Csm_SignatureVerify from [SWS_Dcm_01511] is Crypto_VerifyResultType equal to CRYPTO_E_VER_OK, the Dcm shall send a positive response with authenticationReturnParameter set to 'Ownership verified, Authentication complete' and providing a size of 0 for lengthOfSessionKeyInfo and no sessionKeyInfo.] (RS_Diag_04230)

[SWS_Dcm_01530] Persisting authentication state [If the result of Csm_SignatureVerify from [SWS_Dcm_01511] is Crypto_VerifyResultType equal to CRYPTO_E_VER_OK and the mode rule referenced by DcmDspAuthenticationPersistStateModeRuleRef is evaluated to true, the Dcm shall persist the authentication state, role and white list on that connection.] (RS_Diag_04230)

[SWS_Dcm_01531] Activation of role and white list [The DCM shall consider the role and white list for access control only, if the DCM is in authenticated state.]()

[SWS_Dcm_01532] Re-entering authenticated state [If the Dcm is already in authenticated state while a transition to authentication stated is requested according to [SWS_Dcm_01529], the Dcm shall overwrite the roles and white list and use only the role and white last from the last received certificate.] (RS_Diag_04230)

7.6.2.10.6 AuthenticationConfiguration

[SWS_Dcm_01533] Providing the authentication configuration [If DcmDspAuthentication is configured and an Authentication (0x29) service with sub-function equal to authenticationConfiguration is received, the Dcm shall send a positive response with authenticationReturnParameter set to 'AuthenticationConfiguration APCE'.] (RS_Diag_04230)

7.6.2.11 Service 0x2A - ReadDataByPeriodicIdentifier

[SWS_Dcm_01093] Minimum length check for ReadDataByPeriodicIdentifier [On reception of the UDS Service ReadDataByPeriodicIdentifier (0x2A), the Dcm module shall check the request minimum length. If length of the request is wrong, the Dcm module shall send a NRC 0x13 (Incorrect message length or invalid format).] (RS_Diag_04215)

[SWS_Dcm_01552] Read Periodic DID authentication check for statically defined DIDs [On reception of the UDS Service ReadDataByPeriodicIdentifier (0x2A), the Dcm shall check if the access to all static defined requested DIDs is authenticated and read the data identifiers periodically only if:

- a DcmDspDidReadRole is configured for that DID and the verification according to [SWS_Dcm_01522] was successful or
- the active white list on that connection has for each requested DID one entry with read access that matches that DID.

](*RS_Diag_04233*)

[SWS_Dcm_01553] Read Periodic DID authentication check for dynamically defined DIDs [On reception of the UDS Service ReadDataByPeriodicIdentifier (0x2A), the Dcm shall check if the access to all dynamically defined requested DIDs if the content is based of DIDs or parts of DIDs is authenticated and read the data identifiers periodically only if:

- a DcmDspDidReadRole is configured for that DID and the verification according to [SWS_Dcm_01522] was successful or
- the active white list on that connection has for each requested DID one entry with read access that matches that DID.

](*RS_Diag_04233*)

According to [SWS_Dcm_01537] the authentication checks are only executed if DcmDspAuthentication is configured. In case of a failed authentication the NRC handling is according to [SWS_Dcm_01544] and [SWS_Dcm_01551] applies.

[SWS_Dcm_00721] Session check for ReadDataByPeriodicIdentifier DID [On reception of the UDS Service ReadDataByPeriodicIdentifier (0x2A), for every requested periodicDIDs, the Dcm module shall check if the periodicDID can be read in the current session (see configuration parameter *DcmDspDidReadSessionRef*). If none of the periodicDID can be read in the current session, the Dcm module shall send a NRC 0x31 (RequestOutOfRange).](*RS_Diag_04215*)

[SWS_Dcm_00722] Security level check for ReadDataByPeriodicIdentifier DID [On reception of the UDS Service ReadDataByPeriodicIdentifier (0x2A), for every requested periodicDIDs, the Dcm module shall check if the periodicDID can be read in the current security level (see configuration parameter *DcmDspDidReadSecurityLevelRef*). If not, the Dcm module shall send NRC 0x33 (Security access denied).](*RS_Diag_04215*)

[SWS_Dcm_00820] Mode condition check for ReadDataByPeriodicIdentifier DID [On reception of the UDS Service ReadDataByPeriodicIdentifier (0x2A), for every requested periodicDIDs, the Dcm module shall check if the periodicDID can be read in the current mode condition (see configuration parameter *DcmDspDidReadModeRuleRef*). If not, the Dcm module shall send the calculated negative response code of the reference *DcmModeRule*](*RS_Diag_04215*)

[SWS_Dcm_01097] Checks for DDDIDs in ReadDataByPeriodicIdentifier [On reception of the UDS Service ReadDataByPeriodicIdentifier (0x2A), if verification has been successfully done ([SWS_Dcm_00721], [SWS_Dcm_00722] and [SWS_Dcm_00820]), and if the request contains one or more dynamically defined

DID(s), the `Dcm` module shall do the session, security and mode dependencies checks for all source data in case the configuration parameter `DcmDspDDIDcheckPer-SourceDID` is set to TRUE.] ([RS_Diag_04215](#))

[SWS_Dcm_01098] Condition check for ReadDataByPeriodicIdentifier DID [On reception of the `UDS` Service ReadDataByPeriodicIdentifier (0x2A), for every requested periodicDIDs, the `Dcm` module shall invoke the ConditionCheckRead operation (or the respective C-Function) if configured. In case of a negative result, the returned ErrorCode shall be used as final negative response code.] ([RS_Diag_04215](#))

[SWS_Dcm_01099] Support of dynamic length DIDs [On reception of the `UDS` Service ReadDataByPeriodicIdentifier (0x2A), for every requested periodicDIDs, with a configured dynamic length the `Dcm` module shall invoke the ReadDataLength operation (or the respective C-Function) to retrieve the length of the periodicDID. This length is valid for each ReadData operation till the periodicDID is removed from the scheduler or updated via a new request. This length shall further be used to check against the UUDT size.] ([RS_Diag_04215](#))

[SWS_Dcm_01100] Verifications on all sub-functions except stopSending [On reception of the `UDS` Service ReadDataByPeriodicIdentifier (0x2A) with transmissionMode different than stopSending, the `Dcm` shall do the verification for session, security and mode rule.] ([RS_Diag_04215](#))

[SWS_Dcm_01426] No verifications for sub-function stopSending [On reception of the `UDS` Service ReadDataByPeriodicIdentifier (0x2A) with transmissionMode = stopSending, the `Dcm` shall skip the verification for security and mode rule.] ([RS_Diag_04215](#))

[SWS_Dcm_01427] Dcm behavior on sub-function stopSending without further parameters [On reception of the `UDS` Service ReadDataByPeriodicIdentifier (0x2A) with transmissionMode = stopSending and no periodicDataIdentifier in the request, the `Dcm` shall stop all scheduled periodicDataIdentifier transmissions.] ([RS_Diag_04215](#))

[SWS_Dcm_01428] Dcm behavior on sub-function stopSending with further parameters [On reception of the `UDS` Service ReadDataByPeriodicIdentifier (0x2A) with transmissionMode = stopSending and at least one periodicDataIdentifier is in the request, the `Dcm` shall stop the scheduled periodic data transmissions for all requested and in the current session supported periodicDataIdentifiers.] ([RS_Diag_04215](#))

[SWS_Dcm_00716] Serialisation with S/R data interfaces [To serialize the required AUTOSAR data types (signed- and unsigned integer) into the response message of ReadDataByPeriodicIdentifier responses the target endianness configured in `DcmD- spDataEndianness` shall be considered for `DcmDspData` elements having `DcmD- spDataUsePort` set to `USE_DATA_SENDER_RECEIVER`, `USE_DATA_SENDER_RECEIVER_AS_SERVICE`, `USE_ECU_SIGNAL`. In case `DcmDspDataEndianness` is not present, the `DcmDspDataDefaultEndianness` shall be used instead.] ([RS_Diag_04215](#))

[SWS_Dcm_00843] Ensuring maxim number of periodic DIDs [On reception of the `UDS` Service ReadDataByPeriodicIdentifier (0x2A), the `Dcm` module shall check if the

periodicDataIdentifiers requested in a single request do not exceed the configured `DcmDspMaxPeriodicDidToRead` (maximum length check). Otherwise (in case the number of elements is exceeded) the `Dcm` module shall send a `NRC 0x13` (Incorrect message length or invalid format).] ([RS_Diag_04215](#))

[SWS_Dcm_01094] Behavior on not supported transmissionMode [On reception of the `UDS` Service `ReadDataByPeriodicIdentifier`(0x2A), the `Dcm` module shall check if the `transmissionMode` is supported, otherwise the `Dcm` module shall send a `NRC 0x31`(Request out of range).] ([RS_Diag_04215](#))

Note: With `UDS` Service `ReadDataByPeriodicIdentifier` (0x2A), the tester can start one or more periodicDIDs.

Note: A request of `UDS` Service `ReadDataByPeriodicIdentifier` will contain `DIDs` represented by only one byte, the low byte of the configured `DID`. In all cases the complete `DID` will be constructed by adding 0xF2 as high byte.

[SWS_Dcm_01095] Verification if periodic DID is supported [On reception of the `UDS` Service `ReadDataByPeriodicIdentifier` (0x2A), for every requested periodicDIDs, the `Dcm` module shall check if the periodicDID is supported (see configuration parameter `DcmDspDid`). If none of the periodicDIDs are supported, the `Dcm` module shall send `NRC 0x31` (Request out of range).] ([RS_Diag_04215](#))

[SWS_Dcm_01096] Behavior on unused DIDs [If a `DID` is set as unused (`DcmDspDidUsed` set to FALSE), the `Dcm` shall consider the `DID` as not supported.] ([RS_Diag_04215](#))

[SWS_Dcm_00851] Verification for free scheduler slots [On reception of the `UDS` Service `ReadDataByPeriodicIdentifier`(0x2A) with `transmissionMode` different than 0x04 "stopSending", the `Dcm` module shall check if all requested periodicDataIdentifiers not currently in the periodic scheduler can be added to the scheduler considering the free space of the scheduler (maximum size is defined by configuration parameter `DcmDspMaxPeriodicDidScheduler`). In case the requested periodicDataIdentifiers cannot be added to the scheduler, the `Dcm` shall send a `NRC 0x31` (RequestOut-OfRange).] ([RS_Diag_04215](#))

Note : To optimize the resource consumption AUTOSAR has chosen a simplified approach to validate the request message. ISO recommends checking the size only for currently supported data identifiers.

7.6.2.11.1 Scheduler PeriodicTransmission

Note: The periodic response message layout is according to ISO 14229-1:2013. It contains the periodic data identifier and the data. The service `ID` and `A_PCI` byte is not part of the periodic response message.

[SWS_Dcm_01101] [The `Dcm` shall send all periodic scheduled response by using the configured `DcmDslPeriodicConnections`.] ([RS_Diag_04215](#))

Note : Only UUDT messages (IF-PDUs) are supported

ISO 14229-1:2018 defines two distinct scheduler types for ReadDataByPeriodicIdentifier. Depending on the scheduler type, the `Dcm` has different transmission strategies. The used scheduler type of the server is selected by setting `DcmDspPeriodicTransmissionSchedulerType` to one of the two types.

[SWS_Dcm_01568] Support of periodic transmission type 1 [If `DcmDspPeriodicTransmissionSchedulerType` is set to `SCHEDULER_TYPE1` and the `Dcm` is set up to send PDIDs, the `Dcm` shall trigger the transmission of all scheduled PDIDs each time the configured periodic transmission rate elapses.] ([RS_Diag_04215](#))

[SWS_Dcm_01569] Transmission of one PDID per available connection [If PDID transmission is triggered according to [SWS_Dcm_01568], `Dcm` shall transmit one PDID per available periodic connection starting with the first PDID in the list of scheduled PDIDs.] ([RS_Diag_04215](#))

[SWS_Dcm_01570] Continue in next main function if more PDIDs than available connections [If PDID transmission is triggered according to [SWS_Dcm_01568] and more PDIDs are to transmit than the number of available periodic connections, the `Dcm` shall continue the transmission in the next `Dcm` main function call. Each time the available periodic connections shall be used.] ([RS_Diag_04215](#))

[SWS_Dcm_01571] Overlapping triggers and transmissions [If PDID transmission is triggered according to [SWS_Dcm_01568] or [SWS_Dcm_01572] and the next periodic transmission rate trigger occurs before the `Dcm` has finished sending the scheduled PDIDs according to [SWS_Dcm_01570], the `Dcm` shall continue to transmit PDIDs according to [SWS_Dcm_01570] and schedule the PDIDs of the new trigger after the last previous PDID has been transmitted.] ([RS_Diag_04215](#))

[SWS_Dcm_01572] Support of periodic transmission type 2 [If `DcmDspPeriodicTransmissionSchedulerType` is set to `SCHEDULER_TYPE2` the `Dcm` is set up to send PDIDs and the periodic transmission rate for a scheduler elapses, the `Dcm` shall trigger the transmission of the next scheduled PDIDs on all available periodic connections.] ([RS_Diag_04215](#))

[SWS_Dcm_01573] PDID transmission sequence for scheduler type 2 [For scheduler type 2 transmission of PDIDs within a single elapse of the scheduler, the `Dcm` shall start to transmit the first configured PDID and continue to transmit consecutively all other configured PDIDs. If the last PDID is transmitted, the `Dcm` restarts the sequence with the first configured PDID. If a PDID is sent more than once within a single elapse of the scheduler then the PDIDs contents shall be reloaded with the applicable `DID` / Memory data for every re-transmission.] ([RS_Diag_04215](#))

[SWS_Dcm_01574] Continue in next periodic rate scheduler if more PDIDs than available connections [If a scheduler type 2 PDID transmission is active according to [SWS_Dcm_01572] and the number of scheduled PDIDs is larger than the number of available periodic connections, the `Dcm` shall continue to send the next scheduled PDIDs the next time the periodic transmission rate scheduler elapses.] ([RS_Diag_04215](#))

The following example gives an overview about scheduler type 1 and type 2. They use PDIDs starting at 0xF201 and having all PDID data set to zero. The PDIDs are send on CAN 2.0, using the CAN-IDs 0x6A0, 0x6A1.

[SWS_Dcm_01103] Require previous confirmation before next transmission [The **Dcm** shall trigger a transmission **DcmDslPeriodicTxPduRef** only after the **DcmDslPeriodicTxConfirmationPduId** transmit confirmation for the previously transmitted periodic response is received.] ([RS_Diag_04215](#))

[SWS_Dcm_01104] Transmission error behavior [In case of a PDID transmission error, the **Dcm** shall use always the same order of periodicDIDs per client. Transmission errors shall not influence this order, the **Dcm** shall continue to retry the transmission and start the next PDID only after the PDID was transmitted successfully.] ([RS_Diag_04215](#))

[SWS_Dcm_01105] No negative response for periodic DID after positive response [After periodicDIDs are started and a positive response was sent, the **Dcm** shall start to send the periodic **DID**.] ([RS_Diag_04215](#))

[SWS_Dcm_01106] Sending periodic DIDs without further condition checks [Each time the counter of a periodicDataIdentifiers elapses, the **Dcm** shall retrieve the **DID** data without validating further conditions (i.e. session, security, mode dependencies, ConditionCheckRead and ReadDataLength).] ([RS_Diag_04215](#))

[SWS_Dcm_01107] No periodic DIDs in default session [When the diagnostic session changes to DefaultSession, the **Dcm** shall stop all scheduled periodic **DIDs**.] ([RS_Diag_04215](#))

[SWS_Dcm_01108] On session change send only periodic DIDs with allowed security settings [When the diagnostic session changes to a non-defaultSession, any scheduled periodic **DID** that was restricted by security access shall be stopped.] ([RS_Diag_04215](#))

[SWS_Dcm_01109] On session change send only periodic DIDs allowed in the new session [When the diagnostic session changes to a non-defaultSession, any scheduled periodic DID that is not supported in the new session shall be stopped.] ([RS_Diag_04215](#))

Note: The rate for a specific transmissionMode is defined as the time between any two consecutive response messages with the same periodicDataIdentifier, when only a single periodicDID is scheduled. If multiple periodicDIDs are scheduled concurrently, the effective period between the same periodicDataIdentifier will vary based upon the following design parameters:

- The main function recurrence [DcmTaskTime](#)
- The number of available periodic connections
- The number of periodicDIDs that can be scheduled concurrently (see configuration parameter [DcmDspMaxPeriodicDidScheduler](#)).

[SWS_Dcm_01575] Connection limitation for fast transmission [If [DcmDspPeriodicTransmissionMaxPeriodicFastTransmissions](#) is configured, the [Dcm](#) shall limit the number of used periodic connections for transmissionMode 'sendAtFastRate' to [DcmDspPeriodicTransmissionMaxPeriodicFastTransmissions](#) connections.] ([RS_Diag_04215](#))

[SWS_Dcm_01576] Connection limitation for medium transmission [If [DcmDspPeriodicTransmissionMaxPeriodicMediumTransmissions](#) is configured, the [Dcm](#) shall limit the number of used periodic connections for transmissionMode 'sendAtFastRate' to [DcmDspPeriodicTransmissionMaxPeriodicMediumTransmissions](#) connections.] ([RS_Diag_04215](#))

[SWS_Dcm_01577] Connection limitation for slow transmission [If [DcmDspPeriodicTransmissionMaxPeriodicSlowTransmissions](#) is configured, the [Dcm](#) shall limit the number of used periodic connections for transmissionMode 'sendAtFastRate' to [DcmDspPeriodicTransmissionMaxPeriodicSlowTransmissions](#) connections.] ([RS_Diag_04215](#))

[SWS_Dcm_01110] Periodic DID transmission and security level change [On any security level change, the [Dcm](#) shall stop any scheduled periodic DID, that was restricted by security access, but not supported by the new security level anymore.] ([RS_Diag_04215](#))

[SWS_Dcm_01111] Periodic DDDID transmission and session change [If [DcmDspDDDidCheckPerSourceDID](#) is set to TRUE upon a session change, the [Dcm](#) shall stop any scheduled periodic DDDID, that contains source data not supported in the current session.] ([RS_Diag_04215](#))

[SWS_Dcm_01112] Periodic DDDID transmission and security level change [If `DcmDspDD DIDCheckPerSourcedID` is set to TRUE, upon any security level change, the `Dcm` shall stop any scheduled periodic DDDID that contains source data not supported in the current security level.] ([RS_Diag_04215](#))

[SWS_Dcm_01115] Cancel pending read operations [Upon stopping the periodical read of a data identifier while a pending asynchronous ReadData operation is still in progress, the `Dcm` shall cancel the pending read operation by calling ReadData with `OpStatus=DCM_CANCEL`.] ([RS_Diag_04215](#))

[SWS_Dcm_01117] Stop cancels pending transmissions [Upon stopping the periodical read of a data identifier, the `Dcm` shall cancel pending transmissions of that `DID`.] ([RS_Diag_04215](#))

[SWS_Dcm_01118] Finalizing initiated transmissions upon stop [Upon stopping the periodical read of a data identifier the `Dcm` shall finalize already initiated transmissions of that `DID`.] ([RS_Diag_04215](#))

7.6.2.12 Service 0x2C - DynamicallyDefineDataIdentifier

[SWS_Dcm_00259] [The `DSP` submodule shall implement the DynamicallyDefineDataIdentifier (service 0x2C, diagnostic data access) of the Unified Diagnostic Services.]()

The DynamicallyDefineDataIdentifier service is implemented internally in `Dcm` module.
[SWS_Dcm_00866] [If `DcmDD DIDStorage` configuration parameter is set to FALSE, the `Dcm` shall initialize all DDDIDs as not present at power-up `Dcm_Init`).]()

[SWS_Dcm_00867] [If `DcmDD DIDStorage` configuration parameter is set to TRUE, the `Dcm` shall restore the DDDID definition from NvM at power-up `Dcm_Init`).]()

[SWS_Dcm_00868] [If `DcmDD DIDStorage` configuration parameter is set to TRUE, the `Dcm` shall trigger the storage of the DDDID definition to NvRam (via `NvM_SetRamBlockStatus`).]()

[SWS_Dcm_00646] [On reception of service DynamicallyDefineDataIdentifier with subservice `defineByIdentifier` or `defineByMemoryAddress`, the `Dcm` module shall configure this new `DID` with associated information receive from the diagnostic request: Memory address and memory length or `DID` source, position and size.]()

[SWS_Dcm_00861] [On reception of the `UDS` Service DynamicallyDefineDataIdentifier (0x2C), the `Dcm` module shall check if the DDDID will not exceed the configured parameter value `DcmDspDD DIDMaxElements`. Otherwise (in case the number of elements will be exceeded) the `Dcm` module shall send a `NRC 0x31 (RequestOutOfRange)`.]()

[SWS_Dcm_00854] [On reception of the [UDS](#) Service DynamicallyDefineDataIdentifier (0x2C) with subservice [defineByMemoryAddress](#), the [Dcm](#) shall check if the requested [AddressAndLengthFormatIdentifier](#) is supported (refer to configuration parameter [DcmDspSupportedAddressAndLengthFormatIdentifier](#)), Otherwise the [NRC](#) 0x31 (requestOutOfRange) shall be responded. In case the container [AddressAndLengthFormatIdentifier](#) is not present, the [Dcm](#) shall accept all possible [AddressAndLengthFormatIdentifiers](#).]()

[SWS_Dcm_00647] [On reception of service [DynamicallyDefineDataIdentifier](#) with subservice [clearDynamicallyDefinedDataIdentifier](#), the [Dcm](#) module shall remove the configuration of this DID.]()

[SWS_Dcm_00723] [On reception of the [UDS](#) Service DynamicallyDefineDataIdentifier (0x2C), the [Dcm](#) module shall check if the DDDID can be defined in the current session (see configuration parameter [DcmDspDidReadSessionRef](#)). If not, the [Dcm](#) module shall send a [NRC](#) 0x31 (RequestOutOfRange).]()

[SWS_Dcm_00724] [On reception of the [UDS](#) Service DynamicallyDefineDataIdentifier (0x2C), the [Dcm](#) module shall check if the DDDID can be defined in the current security level (see configuration parameter [DcmDspDidReadSecurityLevelRef](#)). If not, the [Dcm](#) module shall send [NRC](#) 0x33 (Security access denied).]()

[SWS_Dcm_00725] [On reception of the [UDS](#) Service DynamicallyDefineDataIdentifier (0x2C), the [Dcm](#) module shall check if the requested Source-DIDs are supported in the current session (see configuration parameter of referenced [DID DcmDspDidReadSessionRef](#)). If not, the [Dcm](#) module shall send a [NRC](#) 0x31 (RequestOutOfRange).]()

[SWS_Dcm_00726] [On reception of the [UDS](#) Service DynamicallyDefineDataIdentifier (0x2C), the [Dcm](#) module shall check if the requested Source-DID or the [memoryRange](#) are supported in the current security level (see configuration parameter of referenced [DID DcmDspDidReadSecurityLevelRef](#) or [memoryRange DcmDspReadMemoryRangeSecurityLevelRef](#)). If not, the [Dcm](#) module shall send a [NRC](#) 0x33 (Security access denied).]()

[SWS_Dcm_00821] [On reception of the [UDS](#) Service DynamicallyDefineDataIdentifier (0x2C), the [Dcm](#) module shall check if the requested Source-DID or the [memoryRange](#) are supported in the current mode condition (see configuration parameter of referenced [DID DcmDspDidReadModeRuleRef](#) or [memoryRange DcmDspReadMemoryRangeModeRuleRef](#)). If not, the [Dcm](#) module shall send the calculated negative response code of the referenced [DcmModeRule](#).]()

In case of memory address(es), on reception of [ReadDataByIdentifier](#) or [ReadDataByPeriodicIdentifier](#) request for a dynamically defined DID, the [Dcm](#) will use the callout [Dcm_ReadMemory](#) for all contained memory addresses to access the data.

[SWS_Dcm_01051] [On reception of the [UDS](#) Service DynamicallyDefineDataIdentifier (0x2C), if the request message contains different [MemoryIdValue](#) compare to the configured values in [DcmDspMemoryIdInfo](#) container, the [Dcm](#) shall send a [NRC](#) 0x31 (RequestOutOfRange).]()

In case of [DID](#) source(s), on reception of [ReadDataByIdentifier](#) or [ReadDataByPeriodicIdentifier](#) request for a dynamically defined DID, the [Dcm](#) will use the configuration of the contained DIDs to read the data.

7.6.2.13 Service 0x2E - [WriteDataByIdentifier](#)

[SWS_Dcm_00255] [The [Dcm](#) module shall implement the [UDS](#) Service [WriteDataByIdentifier](#) (0x2E) of the Unified Diagnostic Services.]()

When using Service 0x2E, the request of the tester contains a 2-byte [DID](#) and a [dataRecord](#) with the data to be written. The configuration of the [Dcm](#) contains a list of supported DIDs and defines for each configured DID:

- The 2-byte [DID](#) (see configuration parameter [DcmDspDidIdentifier](#))
- For every data of the DID:
 - The function [WriteData](#) to be used for this data (see configuration parameters [DcmDspDataWriteFnc](#) and [DcmDspDataUsePort](#))

[SWS_Dcm_01496] Write UDS DID authentication check [On reception of the UDS Service [WriteDataByIdentifier](#) (0x2E), the [Dcm](#) shall check if the write access to the requested DID is authenticated and write the data identifier only if:

- a [DcmDspDidWriteRole](#) is configured for that DID and the verification according to [\[SWS_Dcm_01522\]](#) was successful or
- the active white list on that connection has for the requested DID one entry with write access that matches that DID.

]([RS_Diag_04233](#))

According to [\[SWS_Dcm_01537\]](#) the authentication checks are only executed if [DcmDspAuthentication](#) is configured. In case of a failed authentication the [NRC](#) handling is according to [\[SWS_Dcm_01544\]](#) and [\[SWS_Dcm_01551\]](#) applies.

[SWS_Dcm_00467] [On reception of the [UDS](#) Service [WriteDataByIdentifier](#) (0x2E), the [Dcm](#) module shall check if the [DID](#) is supported (see configuration parameter [DcmDspDid](#) and [DcmDspDidRange](#)) If not, the [Dcm](#) module shall send [NRC](#) 0x31 (Request out of range).]()

[SWS_Dcm_00562] [If a [DID](#) is set as unused ([DcmDspDidUsed](#) set to FALSE), the [Dcm](#) shall consider the [DID](#) as not supported (according to [\[SWS_Dcm_00467\]](#))]()

[SWS_Dcm_00468] [On reception of the [UDS](#) Service [WriteDataByIdentifier](#) (0x2E), the [Dcm](#) module shall check if the [DID](#) has a Write access configured (see configuration parameter [DcmDspDidWrite](#) in [DcmDspDidInfo](#)). If not, the [Dcm](#) module shall send [NRC](#) 0x31 (Request out of range).]()

[SWS_Dcm_00469] [On reception of the [UDS](#) Service WriteDataByIdentifier (0x2E), the [Dcm](#) module shall check if the [DID](#) can be written in the current session (see configuration parameter [DcmDspDidWriteSessionRef](#)). If not, the [Dcm](#) module shall send a [NRC](#) 0x31 (Request Out of Range).]()

[SWS_Dcm_00470] [On reception of the [UDS](#) Service WriteDataByIdentifier (0x2E), the [Dcm](#) module shall check if the [DID](#) can be written in the current security level (see configuration parameter [DcmDspDidWriteSecurityLevelRef](#)). If not, the [Dcm](#) module shall send [NRC](#) 0x33 (Security access denied).]()

[SWS_Dcm_00822] [On reception of the [UDS](#) Service WriteDataByIdentifier (0x2E), the [Dcm](#) module shall check if the [DID](#) can be written in the current mode condition (see configuration parameter [DcmDspDidWriteModeRuleRef](#)). If not, the [Dcm](#) module shall send the calculated negative response code of the referenced [DcmModeRule](#).]()

[SWS_Dcm_00473] [On reception of the [UDS](#) Service WriteDataByIdentifier (0x2E), if all signals ([DcmDspDidSignal](#)) of the [DID](#) have fixed length ([DcmDspDataType](#) is different than [UINT8_DYN](#)), the [Dcm](#) module shall check if the received data length corresponds to the [DID](#) data length (addition of all [DcmDspDataByteSize](#)).]()

[SWS_Dcm_00395] [After all verifications (see [\[SWS_Dcm_00467\]](#), [\[SWS_Dcm_00468\]](#), [\[SWS_Dcm_00469\]](#), [\[SWS_Dcm_00470\]](#), [\[SWS_Dcm_00473\]](#)) the [Dcm](#) module shall write all the signals ([DcmDspDidSignal](#)) of the [DID](#) by either calling the configured function [DcmDspDataWriteFnc](#) (if parameter [DcmDspDataUsePort](#) is set to [USE_DATA_SYNCH_FNC](#) or [USE_DATA_ASYNCH_FNC](#) or [USE_DATA_ASYNCH_FNC_ERROR](#)) or the associated WriteData operations (if parameter [DcmDspDataUsePort](#) is set to [USE_DATA_SYNCH_CLIENT_SERVER](#) or [USE_DATA_ASYNCH_CLIENT_SERVER](#) or [USE_DATA_ASYNCH_CLIENT_SERVER_ERROR](#)) or the associated SenderReceiver interfaces (if parameter [DcmDspDataUsePort](#) is set to [USE_DATA_SENDER_RECEIVER](#) or to [USE_DATA_SENDER_RECEIVER_AS_SERVICE](#)) with the following parameter values:

Data: the dataRecord form the request

DataLength: the number of bytes in the dataRecord (get from the configuration if the data has fixed length ([DcmDspDataType](#) is different than [UINT8_DYN](#)) or from the diagnostic request length if the data has dynamic length ([DcmDspDataType](#) is set to [UINT8_DYN](#))).]()

[SWS_Dcm_01433] [After all verifications (see [\[SWS_Dcm_00467\]](#), [\[SWS_Dcm_00468\]](#), [\[SWS_Dcm_00469\]](#), [\[SWS_Dcm_00470\]](#), [\[SWS_Dcm_00473\]](#)) for [DID](#)'s with [DcmDspDidUsePort](#) is set to [USE_ATOMIC_SENDER_RECEIVER_INTERFACE](#), [USE_ATOMIC_SENDER_RECEIVER_INTERFACE_AS_SERVICE](#) or [USE_ATOMIC_NV_DATA_INTERFACE](#), the [Dcm](#) module shall write the data by writing the associated sender-receiver or NvDataInterface DataServices_{[DID](#)}.]()

[SWS_Dcm_00541] [If the data is configured as a BlockId of the NvRam (parameter [DcmDspDataUsePort](#) set to [USE_BLOCK_ID](#)), the [Dcm](#) shall :

- 1) Request [NvM_SetBlockLockStatus\(<DcmDspDataBlockIdRef>, FALSE\)](#), to temporarily unlock the NvM Block (It might be locked by executing this procedure before).

- 2) Request `NvM_WriteBlock(<DcmDspDataBlockIdRef >, <DataBuffer>)` with `BlockId` corresponding to the configuration parameter `DcmDspDataBlockIdRef`)
- 3) Poll for completion of write request, using `NvM_GetErrorStatus()`
- 4a) On success (NVM_REQ_OK), the `Dcm` shall issue `NvM_SetBlockLockStatus(<DcmDspDataBlockIdRef >, TRUE)` (to lock the NvM block against further updates from the application) and send a positive response message.
- 4b) Otherwise (on any NvM failure) the `Dcm` module shall trigger a negative response with `NRC 0x72 (GeneralProgrammingFailure.)`

[SWS_Dcm_CONSTR_6039] Signals with variable datalength [Only the last signal (`DcmDspDidSignal`) of a `DID` can have variable datalength (`DcmDspDataType` is set to `UINT8_DYN`).]

In other case the `Dcm` won't be able to split the data from the request.

[SWS_Dcm_00639] [To serialize the request message of `UDS` Service `WriteDataByIdentifier` request into the required AUTOSAR data types (signed- and unsigned integer), the target endianness configured in `DcmDspDataEndianness` shall be considered for `DcmDspData` elements having `DcmDspDataUsePort` set to `USE_DATA_SENDER_RECEIVER, USE_DATA_SENDER_RECEIVER_AS_SERVICE`. In case `DcmDspDataEndianness` is not present, the `DcmDspDataDefaultEndianness` shall be used instead.]()

[SWS_Dcm_CONSTR_6018] [`DcmDspData` elements used in service 0x2E shall not have `DcmDspDataUsePorts` set to `USE_ECU_SIGNAL`.]

[SWS_Dcm_CONSTR_6073] Dependency for `DcmDspDataWriteFnc` [`DcmDspDataWriteFnc` shall be only present if:

- `DcmDspDataUsePort` is set to `USE_DATA_SYNCH_FNC` or
- `DcmDspDataUsePort` is set to `USE_DATA_ASYNC_FNC` or
- `DcmDspDataUsePort` is set to `USE_DATA_ASYNC_FNC_ERROR`

]()

Note: The invocation of functions `BndM_WriteStart` and `BndM_WriteFinalize` are not part of `Dcm` Specification. The functions are called via project specific implementation (e.g. CDD).

[SWS_Dcm_01582] Atomic BndM write operation [After all verifications (see [\[SWS_Dcm_00467\]](#), [\[SWS_Dcm_00468\]](#), [\[SWS_Dcm_00469\]](#), [\[SWS_Dcm_00470\]](#), [\[SWS_Dcm_00473\]](#)) for `DIDs` with `DcmDspDidUsePort` is set to `USE_ATOMIC_BNDM`, the `Dcm` module shall write the data by writing the data to the associated `BlockId` from the `BndM` (`DcmDspDidBndMBlockIdRef`) using the block specific writing function `BndM_WriteBlock_<BlockId.Shortname>`.] ([RS_Diag_04243](#))

[SWS_Dcm_01583] Not allowed atomic BndM write operation [If the [Dcm](#) calls [BndM_WriteBlock_](#)'BlockId.Shortname' according to [\[SWS_Dcm_01582\]](#) and [BndM_WriteBlock_](#)'BlockId.Shortname' returns [E_NOT_OK](#), the [Dcm](#) shall return a negative response 0x24 (requestSequenceError).] ([RS_Diag_04243](#))

Note: The BndM needs to be set into writing mode as a precondition. This is either done by the coding sub-module in [Dcm](#) or by a CDD.

[SWS_Dcm_01584] Positive response on atomic BndM write operation [If the [Dcm](#) has triggered an atomic BndM write operation according to [\[SWS_Dcm_01582\]](#), the [Dcm](#) shall return a positive response if the write operation of the BndM has called [Dcm_BndMWriteBlockFinish](#) with the parameter result set to [E_OK](#).] ([RS_Diag_04243](#))

[SWS_Dcm_01585] Negative response on atomic BndM write operation [If the [Dcm](#) has triggered an atomic BndM write operation according to [\[SWS_Dcm_01582\]](#), the [Dcm](#) shall return a negative response 0x72 (generalProgrammingFailure) if the write operation of the BndM has called [Dcm_BndMWriteBlockFinish](#) with the parameter result set to [E_NOT_OK](#).] ([RS_Diag_04243](#))

Note: The [Dcm](#) needs to ensure that [\[SWS_Dcm_00024\]](#) requirement is respected while waiting on the job finish callback as specified in [\[SWS_Dcm_01584\]](#) and [\[SWS_Dcm_01585\]](#).

[SWS_Dcm_01586] [If the [Dcm](#) is reading or writing a [DID](#) with [DcmDspDidUsePort](#) set to [USE_ATOMIC_BNDM](#), the [Dcm](#) shall transform the [dataRecord](#) into the corresponding BndM type. The [DID](#) data element structure needs to be compatible to the referenced [ImplementationDataType](#) of the [BndMBlockDescriptor](#). For each [DID](#) data element a corresponding sub-element shall exist in the [ImplementationDataType](#) with the same shortname and the basetypes shall be compatible.] ([RS_Diag_04243](#))

[SWS_Dcm_CONSTR_6099] Consistency of BndM Block configuration [If a [DcmDspDid](#) has [DcmDspDidUsePort](#) set to [USE_ATOMIC_BNDM](#), the parameter [DcmDspDidBndMBlockIdRef](#) shall be present.] ()

7.6.2.14 Service 0x2F - InputOutputControlByIdentifier

[SWS_Dcm_00256] [The [Dcm](#) module shall implement the [UDS](#) Service [InputOutputControlByIdentifier](#) (0x2F).] ([RS_Diag_04218](#))

When using Service 0x2F, the request of the tester contains a 2-byte DID.

The configuration of the [Dcm](#) contains a list of supported DID's. For each DID, the [Dcm](#) configuration specifies:

- The 2-bytes [DID](#) (see configuration parameter [DcmDspDidIdentifier](#))
- For every data of the [DID](#) :

- The function `Xxx_ReturnControlToECU()` for this data (see configuration parameters `DcmDspDataReturnControlToEcuFnc` and `DcmDspDataUsePort`)
- The function `Xxx_ResetToDefault()` for this data (see configuration parameters `DcmDspDataResetToDefaultFnc` and `DcmDspDataUsePort`)
- The function `Xxx_FreezeCurrentState()` for this `DID` (see configuration parameters `DcmDspDataFreezeCurrentStateFnc` and `DcmDspDataUsePort`)
- The function `Xxx_ShortTermAdjustment()` for this `DID` (see configuration parameters `DcmDspDataShortTermAdjustmentFnc` and `DcmDspDataUsePort`)
- The sizes of the control record used in the function `Xxx_ShortTermAdjustment()` (see configuration parameter and `DcmDspDataByteSize`)

[SWS_Dcm_00579] [The `Dcm` shall support `InputOutputControlParameter` definitions according to Table 7.27.] (*RS_Diag_04218*)

Hex	Description
00	returnControlToECU
01	resetToDefault
02	freezeCurrentState
03	shortTermAdjustment

Table 7.27: `InputOutputControlParameter` definitions

[SWS_Dcm_01554] IOControl DID authentication check [On reception of the UDS Service `InputOutputControlByIdentifier` (0x2F), the `Dcm` shall check if the control access to the requested `DID` is authenticated and control the IO only if:

- a `DcmDspDidControlRole` is configured for that `DID` and the verification according to [\[SWS_Dcm_01522\]](#) was successful or
- the active white list on that connection has for the requested `DID` one entry with control access that matches that `DID`.

] (*RS_Diag_04218*)

According to [\[SWS_Dcm_01522\]](#) the authentication checks are only executed if `DcmDspAuthentication` is configured. In case of a failed authentication the `NRC` handling is according to [\[SWS_Dcm_01544\]](#) and [\[SWS_Dcm_01551\]](#) applies.

[SWS_Dcm_00563] [On reception of the UDS Service `InputOutputControlByIdentifier` (0x2F), the `Dcm` module shall check if the `DID` is supported (see configuration parameter `DcmDspDid`) If not, the `Dcm` module shall send `NRC` 0x31 (Request out of range).] (*RS_Diag_04218*)

[SWS_Dcm_00564] [If a `DID` is set as unused (`DcmDspDidUsed` set to FALSE), the `Dcm` shall consider the `DID` as not supported (according to [\[SWS_Dcm_00563\]](#))] ([RS_Diag_04218](#))

[SWS_Dcm_00565] [On reception of the `UDS` Service `InputOutputControlByIdentifier` (0x2F), the `Dcm` module shall check if the `DID` has a Control access configured (see configuration parameter `DcmDspDidControl` in `DcmDspDidInfo`). If not, the `Dcm` module shall send `NRC` 0x31 (Request out of range).] ([RS_Diag_04218](#))

[SWS_Dcm_00566] [On reception of the `UDS` Service `InputOutputControlByIdentifier` (0x2F), the `Dcm` module shall check if the `DID` can be control in the current session (see configuration parameter `DcmDspDidControlSessionRef`). If not, the `Dcm` module shall send a `NRC` 0x31 (Request Out of Range).] ()

[SWS_Dcm_00567] [On reception of the `UDS` Service `InputOutputControlByIdentifier` (0x2F), the `Dcm` module shall check if the `DID` can be control in the current security level (see configuration parameter `DcmDspDidControlSecurityLevelRef`). If not, the `Dcm` module shall send `NRC` 0x33 (Security access denied).] ()

[SWS_Dcm_00823] [On reception of the `UDS` Service `InputOutputControlByIdentifier` (0x2F), the `Dcm` module shall check if the `DID` can be control in the current mode condition (see configuration parameter `DcmDspDidControlModeRuleRef`). If not, the `Dcm` module shall send the calculated negative response code of the referenced `DcmModeRule`.] ()

[SWS_Dcm_00580] [On reception of a request for `UDS` Service `InputOutputControlByIdentifier` (0x2F) , if all verifications have been successfully done (see [\[SWS_Dcm_00563\]](#), [\[SWS_Dcm_00565\]](#), [\[SWS_Dcm_00566\]](#), [\[SWS_Dcm_00567\]](#)) and if the data is configured as a "ECU signal" of the `IoHwAb` (parameter `DcmDspDataUsePort`), the `Dcm` shall call the Api `IoHwAb_Dcm_<symbolic name of ECU signal (parameter DcmDspDataEcuSignal)>()` with `InputOutputControlParameter` for the 'action' parameter and in case of `InputOutputControlParameter` is set to 'shortTermAdjustment' the signal value for the "signal" parameter. In this case the requirements [\[SWS_Dcm_00396\]](#), [\[SWS_Dcm_00397\]](#), [\[SWS_Dcm_00398\]](#) and [\[SWS_Dcm_00399\]](#) doesn't apply.] ([RS_Diag_04218](#))

[SWS_Dcm_00581] [In case of more than one supported I/O signal per DataIdentifier and the configuration parameter `DcmDspDidControlMask` is set to `DCM_CONTROLMASK_INTERNAL`, the `Dcm` shall internally consider the parameter `controlEnableMaskRecord` and control only the included signals in the request message.] ([RS_Diag_04218](#))

[SWS_Dcm_CONSTR_6051] [The configuration parameter `DcmDspDidControlMaskSize` shall be only present if `DcmDspDidControlMask` is equal to `DCM_CONTROLMASK_EXTERNAL` or `DCM_CONTROLMASK_INTERNAL`.] ()

[SWS_Dcm_01273] [If the configuration parameter `DcmDspDidControlMask` is set to `DCM_CONTROLMASK_EXTERNAL` or `DCM_CONTROLMASK_INTERNAL`, or the element used in service 0x2F is configured to have an atomic S/R interface, the `Dcm`

shall reject requests without included control enable mask record with the [NRC 0x13 \(incorrectMessageLengthOrInvalidFormat\)](#).] (RS_Diag_04218)

[SWS_Dcm_01274] [If the configuration parameter [DcmDspDidControlMask](#) is set to [DCM_CONTROLMASK_NO](#), the [Dcm](#) shall reject request with included control enable mask record with the [NRC 0x13 \(incorrectMessageLengthOrInvalidFormat\)](#).] (RS_Diag_04218)

[SWS_Dcm_CONSTR_6084] Sender-receiver communication for IOControls is limited to atomic S/R interfaces [If a [DID](#) has a configured [DcmDspDidUsePort = USE_DATA_ELEMENT_SPECIFIC_INTERFACES](#), the possible values of [DcmDspDataUsePort](#) are limited to non S/R interfaces.] (RS_Diag_04218)

[SWS_Dcm_CONSTR_6085] Atomic S/R for IOControls are limited to non-NV interfaces [If a [DID](#) has a configured [DcmDspDidControl](#), the possible values of [DcmDspDidUsePort](#) are limited to atomic S/R interface and [USE_DATA_ELEMENT_SPECIFIC_INTERFACES](#).] (RS_Diag_04218)

[SWS_Dcm_CONSTR_6086] Signals for DIDS with Atomic S/R are not shared with other DIDS [If a [DcmDspDid](#) is configured to have an atomic S/R interface, all [DcmDspDataElements](#) referenced by this [DID](#) shall be referenced only from this [DID](#).] (RS_Diag_04218)

[SWS_Dcm_CONSTR_6050] [If a [DcmDspDid](#) is used in service 0x2F and is configured to have an atomic S/R interface, the [DcmDspDidControlMask](#) shall be set to [DCM_CONTROLMASK_EXTERNAL](#) and the parameter [DcmDspDidControlMaskSize](#) shall be present with a value greater than zero.]()

[SWS_Dcm_00680] Mapping of internal ControlEnableMaskRecord to DID data elements [If [DcmDspDidControlMask](#) is set to [DCM_CONTROLMASK_INTERNAL](#), the [ControlEnableMaskRecord](#) shall be mapped to the [DID](#) data elements by applying the following mapping :

- The most significant bit of the first byte of the [ControlEnableMask](#) shall correspond to the first [DID](#) data element
- The second most significant bit of the first byte of the [ControlEnableMask](#) shall correspond to the second [DID](#) data element and continuing on in this fashion utilizing as many [ControlEnableMask](#) bytes as necessary to map all [DID](#) data elements.

] (RS_Diag_04218)

The [controlEnableMaskRecord](#) is only present, if the [DataIdentifier](#) supports more than one signal.

The [Dcm](#) supports atomic S/R interfaces activated by the configuration [DcmDspDidUsePort](#) set to [USE_ATOMIC_SENDER_RECEIVER_INTERFACE](#) or [USE_ATOMIC_SENDER_RECEIVER_INTERFACE_AS_SERVICE](#). In the text and requirements of this chapter the term 'atomic S/R interface' for IO control means that the IO controlled [DID](#) is configured to one of the two choices.

The service use case [TPS_SWCT_01654] and the [constr_1679] limits the S/R interfaces used for IOControl to explicit S/R communication. In implicit communication is not supported by the [Dcm](#).

[SWS_Dcm_01434] IOControl General execution sequence [On reception of a request for [UDS](#) Service InputOutputControlByIdentifier (0x2F) the [Dcm](#) shall first execute the service verifications according to [\[SWS_Dcm_00563\]](#), [\[SWS_Dcm_00565\]](#), [\[SWS_Dcm_00566\]](#), [\[SWS_Dcm_00567\]](#) and on successful passing the verifications start the configured service processing.] ([RS_Diag_04218](#))

[SWS_Dcm_00396] [On reception of a request for [UDS](#) Service InputOutputControlByIdentifier (0x2F) with `inputOutputControlParameter` equal to `returnControlToEcu`, the [Dcm](#) module shall invoke all impacted configured function of the `controlEnableMaskRecord` (if parameter `DcmDspDataUsePort` set to [USE_DATA_SYNCH_FNC](#) or [USE_DATA_ASYNCH_FNC](#) or [USE_DATA_ASYNCH_FNC_ERROR](#); see configuration parameter `DcmDspDataReturnControlToEcuFnc`). Alternatively call all the associated `ReturnControlToECU` operations (if parameter `DcmDspDataUsePort` set to [USE_DATA_SYNCH_CLIENT_SERVER](#) or [USE_DATA_ASYNCH_CLIENT_SERVER](#) or [USE_DATA_ASYNCH_CLIENT_SERVER_ERROR](#)) for every data of the DID received in the request.] ([RS_Diag_04218](#))

[SWS_Dcm_00397] [On reception of a request for [UDS](#) Service InputOutputControlByIdentifier (0x2F) with `inputOutputControlParameter` equal to `resetToDefault`, the [Dcm](#) module shall invoke all impacted configured function of the `controlEnableMaskRecord` (if parameter `DcmDspDataUsePort` set to [USE_DATA_SYNCH_FNC](#) or [USE_DATA_ASYNCH_FNC](#) or [USE_DATA_ASYNCH_FNC_ERROR](#); see configuration parameter `DcmDspDataResetToDefaultFnc`). Alternatively call all the associated `ResetToDefault` operations (if parameter `DcmDspDataUsePort` set to [USE_DATA_SYNCH_CLIENT_SERVER](#) or [USE_DATA_ASYNCH_CLIENT_SERVER](#) or [USE_DATA_ASYNCH_CLIENT_SERVER_ERROR](#)) for every data of the DID received in the request.] ([RS_Diag_04218](#))

[SWS_Dcm_00398] [On reception of a request for [UDS](#) Service InputOutputControlByIdentifier (0x2F) with `inputOutputControlParameter` equal to `freezeCurrentState`, the [Dcm](#) module shall invoke all impacted configured function of the `controlEnableMaskRecord` (if parameter `DcmDspDataUsePort` set to [USE_DATA_SYNCH_FNC](#) or [USE_DATA_ASYNCH_FNC](#) or [USE_DATA_ASYNCH_FNC_ERROR](#); see configuration parameter `DcmDspDataFreezeCurrentStateFnc`). Alternatively call all the associated `FreezeCurrentState` operations (if parameter `DcmDspDataUsePort` set to [USE_DATA_SYNCH_CLIENT_SERVER](#) or [USE_DATA_ASYNCH_CLIENT_SERVER](#) or [USE_DATA_ASYNCH_CLIENT_SERVER_ERROR](#)) for every data of the DID received in the request.] ([RS_Diag_04218](#))

[SWS_Dcm_00399] [On reception of a request for [UDS](#) Service InputOutputControlByIdentifier (0x2F) with `inputOutputControlParameter` equal to `shortTermAdjustment`, the [Dcm](#) module shall invoke all impacted configured function of

the controlEnableMaskRecord (if parameter `DcmDspDataUsePort` set to `USE_DATA_SYNCH_FNC` or `USE_DATA_ASYNCH_FNC` or `USE_DATA_ASYNCH_FNC_ERROR`; see configuration parameter `DcmDspDataShortTermAdjustmentFnc`). Alternatively call all the associated ShortTermAdjustment operations (if parameter `DcmDspDataUsePort` set to `USE_DATA_SYNCH_CLIENT_SERVER` or `USE_DATA_ASYNCH_CLIENT_SERVER` or `USE_DATA_ASYNCH_CLIENT_SERVER_ERROR`) for every data of the `DID` received in the request.] ([RS_Diag_04218](#))

[SWS_Dcm_00858] Cancel active IO controls on session change [On any session transition, the `Dcm` shall stop all active IO controls according to [\[SWS_Dcm_01435\]](#) which are not supported by the new session.] ([RS_Diag_04119](#))

[SWS_Dcm_00628] Cancel active IO controls in default sessions [On a session transition to default session, the `Dcm` shall stop all active IO controls according to [\[SWS_Dcm_01435\]](#).] ([RS_Diag_04119](#))

[SWS_Dcm_00859] Cancel active IO controls on security level change [On any security level change, the `Dcm` shall stop all active IO controls according to [\[SWS_Dcm_01435\]](#) which are not support by the new security level anymore.] ([RS_Diag_04119](#))

[SWS_Dcm_01435] Dcm cancel IO control sequence [If the `Dcm` needs to cancel an active IO control due to [\[SWS_Dcm_00858\]](#), [\[SWS_Dcm_00628\]](#) or [\[SWS_Dcm_00859\]](#), the `Dcm` shall do the following:

- For controlled data elements with `DcmDspDataUsePort` set to `USE_ECU_SIGNAL`: call to `IoHwAb_Dcm_<symbolic ECU signal name>()` with 'action' parameter set to `ReturnControlToECU`.
- For controlled data elements with `DcmDspDataUsePort` set to `USE_DATA_ASYNCH_CLIENT_SERVER` or `USE_DATA_SYNCH_CLIENT_SERVER` or `USE_DATA_ASYNCH_CLIENT_SERVER_ERROR`: call the C/S interface operation `ReturnControlToECU`.
- For controlled data elements with `DcmDspDataUsePort` set to `USE_DATA_SYNCH_FNC` or `USE_DATA_ASYNCH_FNC` or `USE_DATA_ASYNCH_FNC_ERROR`: call the configured function `Xxx_ReturnControlToECU` (see parameter `DcmDspDataReturnControlToEcuFnc`)
- For controlled `DIDs` with is configured atomic S/R interfaces: update the data element `IOperationRequest` with `inputOutputControlParameter = 0x00`, the `controlEnableMask = 0xFFFFFFFF`¹ and data element `underControl = 0x00`.

][\(RS_Diag_04119\)](#)

[SWS_Dcm_00640] [To serialize the required AUTOSAR data types (signed- and unsigned integer) from the request message (in case of `inputOutputControlParameter` is set to 'shortTermAdjustment') / into the response message of `UDS` Service

¹The size of the mask depends on the parameter `DcmDspDidControlMaskSize`

InputOutputControlByIdentifier responses, the target endianness configured in `DcmD-spDataEndianness` shall be considered for `DcmDspData` elements having `DcmD-spDataUsePort` set to `USE_ECU_SIGNAL`. In case `DcmDspDataEndianness` is not present, the `DcmDspDataDefaultEndianness` shall be used instead.] (*RS_Diag_04218*)

[SWS_Dcm_00682] [The `controlState` in the `ControlStatusRecord` for positive response message of `IoControl` service shall be retrieved using the associated `ReadData` operation/function/`SenderReceiver` after application processing on the IO control request is positively finalized.] (*RS_Diag_04218*)

Beside the Client/Server interface, the `Dcm` provides the `SenderReceiver` interface `IOControlRequest_DID`. The `underControl` data element of this interface is calculated by the `Dcm` with one state bit for each data element identical to the `CEMR`. Applications can directly derive the active control enable status without the need to maintain internal states.

The bit-mask `underControl` contains the accumulated status about which data elements of this particular I/O is currently under diagnostic control. The normal operation state could be derived if the value of `underControl` is set to 0x00 (which is the initial value). Each set bit indicates a data element which is under diagnostic control via `FreezeCurrentState`, 'ResetToDefault' or 'ShortTermAdjustment'.

[SWS_Dcm_01436] Calculation of the `underControl` data element [The `Dcm` shall calculate the `underControl` data element of the S/R interface `IOControlRequest_DID`. The `underControl` is a bitfield of the same size than the `CEMR` of the controlled `DID`. Each bit represents the same data element as in the `CEMR`. A value of 0 indicates, that the corresponding data element is currently not controlled by the `Dcm`, a value of 1 indicates that it is controlled. The initial value is 0, each control request for a data element with `inputOutputControlParameter` equal to `ResetToDefault`, `FreezeCurrentState` or `ShortTermAdjustment` will set the corresponding bit value to 1, and each control request with `inputOutputControlParameter` set to `ReturnControlToECU` will set the bit value to 0.] (*RS_Diag_04218*)

With each I/O Control request a command `IOOperationRequest` is provided to the application to update the input or the respective output. `IOOperationRequest` contains the `inputOutputControlParameter`, the `controlEnableMask` and in case of `ShortTermAdjustment` the `controlState`.

To identify that previous operation has finished (e.g. Write `IOControlRequest_{DID}`), the user can use the update flag mechanism from the `RTE`.

The application needs to update their output values and finalizes the request with the response message `IOOperationResponse` to the `Dcm`. The possible values are:

- 0x00 positive response (similar to `E_OK`)
- 0x10 generalReject
- 0x21 busyRepeatRequest

- 0x22 conditionsNotCorrect
- 0x26 FailurePreventsExecutionOfRequestedAction
- 0x31 requestOutOfRange
- 0x78 ResponsePending (similar to E_PENDING)

Based on the write trigger of the [SWC](#) to `IOControlResponse_DID.IOOperationResponse`, the [Dcm](#) will:

1. wait for final processing (0x78)
2. send a positive response message (0x00)
3. send a negative response message (all other values, except 0xFF)

Figure 7.11: IO-Control with Sender/Receiver interfaces

[SWS_Dcm_01437] `inputOutputControlParameter` idle state [The `inputOutputControlParameter` of data element of `IOOperationRequest` from S/R interface `IOControlRequest_DID` shall have an initial value of 0xFF. This value indicates the application, that the [Dcm](#) is currently not processing an [UDS](#) service to control this `DID`.] ([RS_Diag_04218](#))

[SWS_Dcm_01438] `inputOutputControlParameter` after processing an [UDS](#) `InputOutputControlByIdentifier` (0x2F) service [If the [Dcm](#) is processing an `InputOutputControlByIdentifier` request with `inputOutputControlParameter` equal to `ResetToDefault`, `FreezeCurrentState` or `ShortTermAdjustment`, the [Dcm](#) shall set the `inputOutputControlParameter` of data element of `IOOperationRequest` from S/R interface `IOControlRequest_DID` to the idle state 0xFF after the application has set the `IOControlResponse_DID.IOOperationResponse` to 0x00 and before processing other `InputOutputControlByIdentifier` requests.] ([RS_Diag_04218](#))

Upon the [Dcm](#) writes `IOOperationRequest` of `IOControlRequest_DID` the [SWC](#) processes the IO control request. The [SWC](#) informs the [Dcm](#) about the current processing state by updating `IOControlResponse_DID.IOOperationResponse`.

[SWS_Dcm_01439] Positive response based on IOOperationResponse [If the **Dcm** is processing an InputOutputControlByIdentifier request, it shall reply with a positive response, if the applications set **IOControlResponse_DID.IOOperationResponse** to 0x00.] *(RS_Diag_04218)*

[SWS_Dcm_01440] Negative response based on IOOperationResponse [If the **Dcm** is processing an InputOutputControlByIdentifier request, it shall reply with a negative response with the **NRC IOControlResponse_DID.IOOperationResponse**, if the applications set **IOControlResponse_DID.IOOperationResponse** a value different to 0x00 and 0x78.] *(RS_Diag_04218)*

[SWS_Dcm_01441] RCRP based on IOOperationResponse [If the **Dcm** is processing an InputOutputControlByIdentifier request and the **IOControlResponse_DID.IOOperationResponse** has a value of 0x78, the **Dcm** shall wait until the **IOControlResponse_DID.IOOperationResponse** gets a value different to 0x78 and send **RCRP** according to **[SWS_Dcm_00024]**.] *(RS_Diag_04218)*

Note: As shown in figure ??: Sequence diagram for resetToDefault, freezeCurrentState and shortTermAdjustment, the trigger from the **SW-C** to the **Dcm** is the explicit S/R write operation. The use of the **RTE** functionality "IsUpdated" is a possible mechanism for the **Dcm** to detect a write from **SW-C** to the S/R data element.

[SWS_Dcm_01275] Common action for all inputOutputControlParameter operations with atomic S/R [If the **Dcm** is processing an InputOutputControlByIdentifier request for a **DID** configured atomic S/R interface, the **Dcm** module shall update in the **IOControlRequest_DID** the data element **IOOperationRequest** with

1. **controlEnableMask** = **controlEnableMaskRecord** of the request message
2. **inputOutputControlParameter** = **inputOutputControlParameter** from the request message

]*(RS_Diag_04218)*

The value 0xFF of the **inputOutputControlParameter** of the command **IOOperationRequest** is the 'idle' state. The values 0x00 (ReturnControlToECU), 0x01 (ResetToDefault), 0x02 (FreezeCurrentState) or 0x03 (ShortTermAdjustment) start the request processing and include the control option **inputOutputControlParameter**, **controlEnableMask** and **controlState** (for ShortTermAdjustment only).

[SWS_Dcm_01277] Additional action for InputOutputControl operations for ShortTermAdjustment with atomic S/R [If the **Dcm** is processing an InputOutputControlByIdentifier request with **inputOutputControlParameter** equal to **ShortTermAdjustment** for a **DID** with configured atomic S/R interface, in addition to **[SWS_Dcm_01275]** the **Dcm** module shall update in the **IOControlRequest_DID** the data element **controlState** with content of the **controlState** from the request message.] *(RS_Diag_04218)*

Note: The `controlState` is a separate data element that it can be optionally processed by a data transformer to transform the byte stream into a composite type (see Figure 7.11: IO-Control with Sender/Receiver interfaces).

An example of the `Dcm` S/R interaction is given in Figure 7.12 and Figure 7.13. For `ReturnControlToECU` the data from the request is provided to the application, the `Dcm` will continue to finalize the request after writing the data into the S/R ports. All other sub-functions will wait for the application providing the response 0x00 or an `code`.

- `DcmDspDataUsePort` is set to `USE_DATA_ASYNCH_FNC` or
- `DcmDspDataUsePort` is set to `USE_DATA_ASYNCH_FNC_ERROR`

]()

[SWS_Dcm_CONSTR_6082] Dependency for `DcmDspDidControlMaskSize` [`DcmDspDidControlMaskSize` larger than 4 shall be only allowed if `DcmDspDataUsePort` is set to `USE_DATA_ASYNCH_CLIENT_SERVER`, `USE_DATA_ASYNCH_CLIENT_SERVER_ERROR` or `USE_DATA_SYNCH_CLIENT_SERVER`. Note: ControlEnableMask larger than 32 bits is a very rare use case. Therefore the `Dcm` supports only C/S interfaces to solve this use case.]()

7.6.2.15 Service 0x31 - RoutineControl

[SWS_Dcm_00257] [The `Dcm` module shall implement the `UDS` Service `RoutineControl` (0x31) for subFunctions `startRoutine`, `stopRoutine` and `requestsRoutineResults`.]()

A tester can use [UDS](#) Service 0x31 to start, stop or obtain the results of a routine identified by a 2-byte routineldentifier. The [Dcm](#) module configuration contains a list of the routineldentifiers (see configuration parameter [DcmDspRoutineIdentifier](#)) supported by the DCM. For each routineldentifier, the [Dcm](#) configuration specifies:

- The function `Xxx_Start()` associated with this routineldentifier (see configuration parameters [DcmDspStartRoutineFnc](#) and [DcmDspRoutineUsePort](#))
- List of signal available in the request and in the response (see configuration parameters [DcmDspStartRoutineIn](#) and [DcmDspStartRoutineOut](#))
- The function `Xxx_Stop()` associated with this routineldentifier (see configuration parameters [DcmDspStopRoutineFnc](#) and [DcmDspRoutineUsePort](#))
- List of signal available in the request and in the response (see configuration parameters [DcmDspStopRoutineIn](#) and [DcmDspStopRoutineOut](#))
- The function `Xxx_RequestResults()` associated with this routineldentifier (see configuration parameters [DcmDspRequestRoutineResultsFnc](#) and [DcmDspRoutineUsePort](#))
- List of signal available in the request and in the response (see configuration parameters [DcmDspRequestRoutineResultsIn](#) and [DcmDspRequestRoutineResultsOut](#))

[SWS_Dcm_01442] [If [DcmDspRoutineUsePort](#) is set to true, the [Dcm](#) shall call the corresponding operation of the C/S interfaces `RoutineServices_RoutineName` to process this routine.] ([RS_Diag_04224](#))

A routine handler processes the diagnostic routine control request. The [Dcm](#) passes the `routineControlOption` as input parameters to the routine handler. The routine processes the request and writes the result to the output parameters of the routine handler call. In case of shared Rx and Tx buffer, there are two cases where writing to the output parameters of the routine control can cause overwriting of the input parameters:

- a routine control uses arrays as output parameters (call by reference)
- a routine control writes to output parameters and returns `DCM_E_PENDING`. It is called again with `DcmOpstatus` set to `DCM_PENDING`. The input parameters are derived from the Rx buffer that was overwritten by the previous write to the output parameters

For efficient memory consumption it is controllable, if the [Dcm](#) applies further strategies to separate input and output parameters in those situations.

[SWS_Dcm_01580] Input and output consistency during C/S based routine handling [If [DcmDspRoutineUsePort](#) is set to TRUE and the `ClientServerOperation.diagArgIntegrity` of that operation is also set to TRUE, the [Dcm](#) shall ensure that the routine handler in the C/S interfaces `RoutineServices_RoutineName` writing to the output parameters will not overwrite the input parameters.] ([RS_Diag_04224](#))

[SWS_Dcm_01581] "Routine argument integrity for C/S calls [If `DcmDspRoutineUsePort` is set to true and `DcmDspRoutineInterfaceArgumentIntegrity` is configured, the `Dcm` shall create the corresponding operation of the C/S interface `RoutineServices_RoutineName` with `ClientServerOperation.diagArgIntegrity` set to `DcmDspRoutineInterfaceArgumentIntegrity`.] (RS_Diag_04224)

[SWS_Dcm_CONSTR_6097] Availability of `DcmDspRoutineInterfaceArgumentIntegrity` [`DcmDspRoutineInterfaceArgumentIntegrity` shall only be available if the corresponding `DcmDspRoutine` has `DcmDspRoutineUsePort` is set to true.] ()

[SWS_Dcm_01443] [If `DcmDspRoutineUsePort` is set to false, the `Dcm` shall use the configured callout functions for routine operations.] (RS_Diag_04224)

[SWS_Dcm_00568] [On reception of the UDS Service RoutineControl (0x31), the `Dcm` module shall check if the Routine is supported (see configuration parameter `DcmDspRoutine`) If not, the `Dcm` module shall send `NRC` 0x31 (Request out of range).] ()

[SWS_Dcm_00569] [If a Routine is set as unused (`DcmDspRoutineUsed` set to FALSE), the `Dcm` shall consider the Routine as not supported (according to [SWS_Dcm_00568])] ()

[SWS_Dcm_01555] StartRoutine authentication check [On reception of the UDS Service RoutineControl (0x31) with sub-function startRoutine, the `Dcm` shall check if the access to the requested routine identifier is authenticated and process the routine only if:

- a `DcmDspStartRoutineRole` is configured for that routine and the verification according to [SWS_Dcm_01522] was successful or
- the active white list on that connection has one RID entry with sub-function access set to startRoutine that matches that service and sub-function.

] (RS_Diag_04233)

[SWS_Dcm_01556] StopRoutine authentication check [On reception of the UDS Service RoutineControl (0x31) with sub-function stopRoutine, the `Dcm` shall check if the access to the requested routine identifier is authenticated and process the routine only if:

- a `DcmDspStopRoutineRole` is configured for that routine and the verification according to [SWS_Dcm_01522] was successful or
- the active white list on that connection has one RID entry with sub-function access set to stopRoutine that matches that service and sub-function.

] (RS_Diag_04233)

[SWS_Dcm_01557] RequestRoutineResult authentication check [On reception of the UDS Service RoutineControl (0x31) with sub-function requestRoutineResult, the

Dcm shall check if the access to the requested routine identifier is authenticated and process the routine only if:

- a DcmDspRequestRoutineResultsRole is configured for that routine and the verification according to [SWS_Dcm_01522] was successful or
- the active white list on that connection has one RID entry with sub-function access set to requestRoutineResults that matches that service and sub-function.

](*RS_Diag_04233*)

According to [SWS_Dcm_01537] the authentication checks are only executed if [DcmDspAuthentication](#) is configured. In case of a failed authentication the NRC handling is according to [SWS_Dcm_01544] and [SWS_Dcm_01551] applies.

The service RoutineControl (0x31) is of exotic nature and has both, a sub-function and an identifier. [UDS](#) defines a different behavior for this service. Permission checks for session and security are done on identifier level rather than on sub-function level.

[SWS_Dcm_CONSTR_6100] Same session and security settings for same routine identifier [All [DcmDspCommonAuthorization](#) that are referenced via [DcmDspStartRoutineCommonAuthorizationRef](#), [DcmDspStopRoutineCommonAuthorizationRef](#) or [DcmDspRequestRoutineResultsCommonAuthorizationRef](#) from a the same [DcmDspRoutine](#), shall have the same (identical) set of referenced [DcmDspCommonAuthorizationSecurityLevelRef](#) and [DcmDspCommonAuthorizationSessionRef](#).]()

[SWS_Dcm_00570] [On reception of the [UDS](#) Service RoutineControl (0x31), the [Dcm](#) module shall check if the Routine can be executed in the current session (see configuration parameters [DcmDspStartRoutineCommonAuthorizationRef](#), [DcmDspStopRoutineCommonAuthorizationRef](#) and [DcmDspRequestRoutineResultsCommonAuthorizationRef](#)). If not, the [Dcm](#) module shall send a [NRC](#) 0x31 (Request Out of Range).]()

[SWS_Dcm_00571] [On reception of the [UDS](#) Service RoutineControl (0x31), the [Dcm](#) module shall check if the Routine can be executed in the current security level (see configuration parameter [DcmDspStartRoutineCommonAuthorizationRef](#), [DcmDspStopRoutineCommonAuthorizationRef](#) and [DcmDspRequestRoutineResultsCommonAuthorizationRef](#)). If not, the [Dcm](#) module shall send [NRC](#) 0x33 (Security access denied).]()

[SWS_Dcm_00869] [On reception of the [UDS](#) Service RoutineControl (0x31), the [Dcm](#) module shall check if the SubFunction to the corresponding Routine is supported (see existence of configuration container [DcmDspStopRoutine](#) for SubFunction 0x02; [DcmDspRequestRoutineResults](#) for SubFunction 0x03). If not, the [Dcm](#) module shall send [NRC](#) 0x12 (SubFunction not supported).]()

[SWS_Dcm_01169] [On reception of the [UDS](#) Service RoutineControl (0x31) with SubFunction startRoutine, the [Dcm](#) module shall check if the Routine can be executed in

the current mode condition (see configuration parameter `DcmDspStartRoutineCommonAuthorizationRef`). If not, the `Dcm` module shall send the calculated negative response code of the referenced `DcmModeRule`.]()

[SWS_Dcm_01170] [On reception of the `UDS` Service `RoutineControl` (0x31) with Sub-Function `stopRoutine`, the `Dcm` module shall check if the Routine can be executed in the current mode condition (see configuration parameter `DcmDspStopRoutineCommonAuthorizationRef`). If not, the `Dcm` module shall send the calculated negative response code of the referenced `DcmModeRule`.]()

[SWS_Dcm_01171] [On reception of the `UDS` Service `RoutineControl` (0x31) with Sub-Function `requestRoutineResults`, the `Dcm` module shall check if the Routine can be executed in the current mode condition (see configuration parameter `DcmDspRequestRoutineResultsCommonAuthorizationRef`). If not, the `Dcm` module shall send the calculated negative response code of the referenced `DcmModeRule`.]()

Routines have different input and output parameters depending on the routine configuration (e.g. `DcmDspStartRoutineIn` for input parameter for the routine start service). The signature of the called routine operations `Xxx_Start`, `Xxx_Stop` and `Xxx_RequestResults` is depending on this configuration. The defined parameters for input and output routine data are optional, and marked in brackets '[]' in the definition in [SWS_Dcm_01203], [SWS_Dcm_01204] and [SWS_Dcm_91013].

[SWS_Dcm_01360] [For each configured routine input signal in `DcmDspStartRoutineInSignal`, `DcmDspStopRoutineInSignal` or `DcmDspRequestRoutineResultsInSignal` with a signal type unequal to `VARIABLE_LENGTH`, the optional parameter '`DcmDspRoutineSignalType dataIn_n`' shall be provided in the corresponding operations in [SWS_Dcm_01203], [SWS_Dcm_01204] or [SWS_Dcm_91013].]()

[SWS_Dcm_01361] [For a configured routine input signal in `DcmDspStartRoutineInSignal`, `DcmDspStopRoutineInSignal` or `DcmDspRequestRoutineResultsInSignal` with a signal type equal to `VARIABLE_LENGTH` the optional parameter `const 'uint8 * dataInVar'` shall be provided in the corresponding operations in [SWS_Dcm_01203] [SWS_Dcm_01204] or [SWS_Dcm_91013].]()

[SWS_Dcm_01362] [For each configured routine output signal in `DcmDspStartRoutineOutSignal`, `DcmDspStopRoutineOutSignal` or `DcmDspRequestRoutineResultsOutSignal` with a signal type unequal to `VARIABLE_LENGTH` the optional parameter '`DcmDspRoutineSignalType dataOut_n`' shall be provided in the corresponding operations in [SWS_Dcm_01203], [SWS_Dcm_01204] or [SWS_Dcm_91013].]()

[SWS_Dcm_01363] [For a configured routine output signal in `DcmDspStartRoutineOutSignal`, `DcmDspStopRoutineOutSignal` or `DcmDspRequestRoutineResultsOutSignal` with a signal type equal to `VARIABLE_LENGTH` the optional parameter `const 'uint8 * dataOutVar'` shall be provided in the corresponding operations in [SWS_Dcm_01203], [SWS_Dcm_01204] or [SWS_Dcm_91013].]()

[SWS_Dcm_01364] [The optional in/out parameter `currentDataLength` in [SWS_Dcm_01203], [SWS_Dcm_01204] or [SWS_Dcm_91013] is always present if

at least one of the routine input signal data or routine output signal data have a signal with routine type 'VARIABLE_LENGTH'.]()

Note: The 'currentDataLength' parameter as in/out parameter contains the data length in bytes of the 'dataInVar' while calling the operation and it returns the length in bytes of the 'dataOutVar'. As 'dataInVar' and 'dataOutVar' are optional, 'currentDataLength' is only present if at least one of this optional parameter is used.

[SWS_Dcm_00590] [When receiving a request for [UDS](#) Service RoutineControl (0x31) if all verifications have been successfully done (see [\[SWS_Dcm_00568\]](#), [\[SWS_Dcm_00570\]](#), [\[SWS_Dcm_00571\]](#)), the [Dcm](#) module shall split the routineControlOptionRecord received according of the list of input signal configured for this routine (see configuration parameters [DcmDspStartRoutineIn](#), [DcmDspStopRoutineIn](#), [DcmDspRequestRoutineResultsIn](#))].()

[SWS_Dcm_00495] 「On reception of the [UDS](#) Service ReadMemoryByAddress (0x23), and after verification of the validity of the request (see [\[SWS_Dcm_00493\]](#) and [\[SWS_Dcm_00494\]](#)) the [Dcm](#) module shall call the callout [Dcm_ReadMemory](#).」()

[SWS_Dcm_01053] [On reception of the [UDS](#) Service ReadMemoryByAddress (0x23), if the request message contains different MemoryIdValue compare to the configured values in [DcmDspMemoryIdInfo](#) container, the [Dcm](#) shall send a [NRC](#) 0x31 (RequestOutOfRange).]()

[SWS_Dcm_01158] [The configured ranges of memory address ([DcmDspReadMemoryRangeHigh](#) and [DcmDspReadMemoryRangeLow](#) or [DcmDspReadMemoryRangeByLabelHigh](#) and [DcmDspReadMemoryRangeByLabelLow](#)) shall not overlap each other.]()

[SWS_Dcm_01359] [On reception of the [UDS](#) Service ReadMemoryByAddress (0x23), the [Dcm](#) shall check if the complete memory range (from 'memoryAddress' parameter to 'memoryAddress + memorySize -1') can be read in the current session (see [DcmDspReadMemoryRangeSessionLevelRef](#)). If the session is not correct, the [Dcm](#) module shall send [NRC](#) 0x31 (RequestOutOfRange).]()

[SWS_Dcm_00644] [If the operation [Dcm_ReadMemory](#) returns [DCM_READ_FAILED](#), the [Dcm](#) module shall send a negative response with [NRC](#) code equal to the parameter [ErrorCode](#) parameter value.]()

[SWS_Dcm_00839] [If the call to [Dcm_ReadMemory](#) returns [DCM_READ_FORCE_RCRRP](#), the [Dcm](#) shall invoke the transmit request for RCR-RP ([NRC](#) 0x78 transmission) and the [Dcm](#) shall not realize further invocation of the operation till RCR-RP is transmitted.] ([RS_Diag_04249](#))

[SWS_Dcm_00840] [After transmit confirmation of a RCR-RP transmitted on the context of [\[SWS_Dcm_00839\]](#), the [Dcm](#) calls, from [Dcm_MainFunction](#) (due to call context), [Dcm_ReadMemory](#) again with [OpStatus](#) = [DCM_FORCE_RCRRP_OK](#).]()

7.6.2.19 Service 0x34 - RequestDownload

This service is used to request the start of a download process.

[SWS_Dcm_00496] [The [Dcm](#) module shall implement the RequestDownload (service 0x34) of the Unified Diagnostic Services.] ([RS_Diag_04033](#))

[SWS_Dcm_00856] [On reception of the [UDS](#) ServiceRequestDownload (0x34), the [Dcm](#) shall check if the requested [AddressAndLengthFormatIdentifier](#) is supported (refer to configuration parameter [DcmDspSupportedAddressAndLengthFormatIdentifier](#)), Otherwise the [NRC](#) 0x31 (requestOutOfRange) shall be responded. In case the container [AddressAndLengthFormatIdentifier](#) is not present, the [Dcm](#) shall accept all possible [AddressAndLengthFormatIdentifiers](#).]()

[SWS_Dcm_01057] [On reception of the [UDS](#) ServiceRequestDownload (0x34), if the request message contains different MemoryIdValue compare to the configured values in [DcmDspMemoryIdInfo](#) container, the [Dcm](#) shall send a [NRC](#) 0x31 (RequestOutOfRange).]()

[SWS_Dcm_01132] [NRC described in Table 7.28 shall be the responsibility of the callout function.]()

NRC	Use Case
0x31 requestOutOfRange	The specified dataFormatIdentifier is not valid.
0x70 uploadDownload-NotAccepted	An attempt to download to a server's memory cannot be accomplished due to some fault conditions. Note: this NRC will be handled by the callout only if mode rule is not used for this case

Table 7.28: NRC managed by callout function for service 0x34

Note: the callout function can, if needed, return also other NRC but the ones above won't be treated by the Dcm module.

[SWS_Dcm_00757] [If the operation `Xxx_ProcessRequestDownload` returns value `E_NOT_OK`, the Dcm module shall send a negative response with NRC code equal to the parameter ErrorCode parameter value.]()

[SWS_Dcm_01417] [Upon calling `Xxx_ProcessRequestDownload`, the Dcm shall write the maximum possible buffer size into the `BlockLength` parameter.] (*RS_Diag_04033*)

[SWS_Dcm_01418] [If the function call `Xxx_ProcessRequestDownload` returns a requested buffer length larger than the supported buffer length of the current protocol connection, the Dcm shall report the Det error `DCM_E_INTERFACE_BUFFER_OVERFLOW`.] (*RS_Diag_04033*) For definition of `DCM_E_INTERFACE_BUFFER_OVERFLOW` see [SWS_Dcm_00040].

[SWS_Dcm_01419] [If the function call `Xxx_ProcessRequestDownload` returns a requested buffer length smaller or equal than the supported buffer length of the current protocol connection, the Dcm shall return the `BlockLength` value within the `maxNumberOfBlockLength` parameter of the positive response.] (*RS_Diag_04033*)

7.6.2.20 Service 0x35 - RequestUpload

This service is used to request the start of a upload process.

[SWS_Dcm_00499] [The Dcm module shall implement the RequestUpload (service 0x35) of the Unified Diagnostic Services.] (*RS_Diag_04033*)

[SWS_Dcm_00857] [On reception of the UDS RequestUpload (0x35), the Dcm shall check if the requested `AddressAndLengthFormatIdentifier` is supported (refer to configuration parameter `DcmDspSupportedAddressAndLengthFormatIdentifier`), Otherwise the NRC 0x31 (requestOutOfRange) shall be responded. In case the container `AddressAndLengthFormatIdentifier` is not present, the Dcm shall accept all possible `AddressAndLengthFormatIdentifiers`.]()

[SWS_Dcm_01055] [On reception of the [UDS](#) RequestUpload (0x35), if the request message contains different MemoryIdValue compare to the configured values in [DcmD-spMemoryIdInfo](#) container, the [Dcm](#) shall send a [NRC](#) 0x31 (RequestOutOfRange).]()

[SWS_Dcm_01133] [[NRC](#) described in Table 7.29 shall be the responsibility of the callout function.]()

NRC	Use Case
0x31 - requestOutOfRange	The specified dataFormatIdentifier is not valid.
0x70 - uploadDownload-NotAccepted	An attempt to download to a server's memory cannot be accomplished due to some fault conditions. Note: this NRC will be handled by the callout only if mode rule is not used for this case

Table 7.29: NRC managed by callout function for service 0x35

Note: the callout function can, if needed, return also other [NRC](#) but the ones above won't be treated by the [Dcm](#) module.

[SWS_Dcm_00758] [If the operation [Xxx_ProcessRequestUpload](#) returns value [E_NOT_OK](#), the [Dcm](#) module shall send a negative response with [NRC](#) code equal to the parameter ErrorCode parameter value.]()

[SWS_Dcm_01420] [Upon calling [Xxx_ProcessRequestUpload](#), the [Dcm](#) shall write the maximum possible buffer size into the [BlockLength](#) parameter.]([RS_Diag_04033](#))

[SWS_Dcm_01421] [If the function call [Xxx_ProcessRequestUpload](#) returns a requested buffer length larger than the supported buffer length of the current protocol connection, the [Dcm](#) shall report the [Det](#) error [DCM_E_INTERFACE_BUFFER_OVERFLOW](#).] ([RS_Diag_04033](#)) For definition of [DCM_E_INTERFACE_BUFFER_OVERFLOW](#) see [\[SWS_Dcm_00040\]](#).

[SWS_Dcm_01422] [If the function call [Xxx_ProcessRequestUpload](#) returns a requested buffer length smaller or equal than the supported buffer length of the current protocol connection, the [Dcm](#) shall return the [BlockLength](#) value within the [maxNumberOfBlockLength](#) parameter of the positive response.] ([RS_Diag_04033](#))

7.6.2.21 Service 0x36 - TransferData

This service is used to transfer data during a download or upload process.

[SWS_Dcm_00502] [The [Dcm](#) module shall implement the TransferData (service 0x36) of the Unified Diagnostic Services.] ([RS_Diag_04033](#))

[SWS_Dcm_00503] [On reception of the [UDS](#) Service TransferData (0x36), if a download process is running (RequestDownload service has been previously received)

and the request format is correct, the [Dcm](#) module shall call the callout [Xxx_ProcessTransferDataWrite.](#).] ([RS_Diag_04033](#))

[SWS_Dcm_00504] [On reception of the [UDS](#) Service TransferData (0x36), if an upload process is running (RequestUpload service has been previously received) and the request format is correct, the [Dcm](#) module shall call the callout [Xxx_ProcessTransferDataRead.](#).] ([RS_Diag_04033](#))

[SWS_Dcm_00645] [On reception of the [UDS](#) Service TransferData (0x36), if a block sequence error is detected, the [Dcm](#) module shall trigger a negative response with [NRC 0x73](#) (WrongBlockSequenceCounter)] ()

[SWS_Dcm_01444] [On reception of the [UDS](#) Service TransferData (0x36), if a file download is running (RequestFileTransfer service has been previously received with 0x01 (AddFile) or 0x03 (ReplaceFile)) and the request format is correct, the [Dcm](#) module shall call the callout [Dcm_WriteFile.](#).] ()

[SWS_Dcm_01445] [On reception of the [UDS](#) Service TransferData (0x36), if a file or directory information upload is running (RequestFileTransfer service has been previously received with 0x04 (ReadFile) or 0x05 (ReadDir)) and the request format is correct, the [Dcm](#) module shall call the callout [Dcm_ReadFileOrDir.](#).] ()

[SWS_Dcm_01173] [NRCs described in Table 7.30 shall be the responsibility of the callout function.] ()

NRC	Use Case
0x24 - requestSequenceError	only for the following conditions: If the RequestDownload or RequestUpload service is active, but the server has already received all data as determined by the memorySize parameter in the active RequestDownload or RequestUpload service
0x31 - requestOutOfRange	Only for the following conditions: The transferRequestParameterRecord contains additional control parameters (e.g. additional address information) and this control information is invalid. The transferRequestParameterRecord is not consistent with the server's memory alignment constraints
0x71 - transferDataSuspended	The data transfer operation was halted due to some fault.
0x72 - generalProgrammingFailure	If the server detects an error when finalizing the data transfer between the client and server (e.g., via an integrity check).
0x92 - voltageTooHigh	The voltage measured is higher than the maximum acceptable voltage for downloading data.
0x93 - voltageTooLow	The voltage measured is under the minimum acceptable voltage for downloading data.

Table 7.30: NRC managed by callout function for service 0x36

Note: the callout function can, if needed, return also other NRCs but the ones above won't be treated by the [Dcm](#) module.

7.6.2.22 Service 0x37 - RequestTransferExit

This service is used to terminate a download or upload process.

[SWS_Dcm_00505] [The [Dcm](#) module shall implement the RequestTransferExit (service 0x37) of the Unified Diagnostic Services.] ([RS_Diag_04033](#))

[SWS_Dcm_01134] [[NRC](#) described in Table 7.31 shall be the responsibility of the callout function.]()

NRC	Use Case
0x24 - requestSequenceError	The programming process is not completed when a request for this service is received.
0x72 - generalProgrammingFailure	If the server detects an error when finalizing the data transfer between the client and server (e.g., via an integrity check).

Table 7.31: NRC managed by callout function for service 0x37

Note: the callout function can, if needed, return also other [NRC](#) but the ones above won't be treated by the [Dcm](#) module.

[SWS_Dcm_00759] [If the operation [Xxx_ProcessRequestTransferExit](#) returns value E_NOT_OK, the [Dcm](#) module shall send a negative response with [NRC](#) code equal to the parameter ErrorCode parameter value.]()

7.6.2.23 Service 0x38 - RequestFileTransfer

[SWS_Dcm_01083] [The [Dcm](#) module shall implement the RequestFileTransfer (service 0x38) of the Unified Diagnostic Services.]()

This service is used to request the start of a file transfer process according to ISO-14229-1.

[SWS_Dcm_01446] [If the [DcmRequestFileTransferUsePort](#) is set to TRUE the [Dcm](#) shall use C/S calls of the interface RequestFileTransfer for all RequestFileTransfer related callouts.]()

[SWS_Dcm_01447] [If the [DcmRequestFileTransferUsePort](#) is set to FALSE the [Dcm](#) shall use C function calls for all RequestFileTransfer related callouts.]()

[SWS_Dcm_01448] [If the fileSizeParameterLength parameter in the RequestFileTransfer request is present and outside the closed interval [0x01..0x08], the [Dcm](#) shall send a negative response with [NRC](#) 0x31 (RequestOutOfRange).]()

[SWS_Dcm_01449] [If the modeOfOperation parameter in the RequestFileTransfer request is not supported (0x00 or greater than 0x05), the [Dcm](#) shall send a negative response with [NRC](#) 0x31 (RequestOutOfRange).]()

[SWS_Dcm_01450] [The [Dcm](#) shall process RequestFileTransfer according to [5] and, in case of modeOfOperation equal to 0x01 (AddFile) call [XXX_ProcessRequestAddFile](#) after the full length check.]()

[SWS_Dcm_01451] [The [Dcm](#) shall process RequestFileTransfer according to [5] and, in case of modeOfOperation equal to 0x02 (DeleteFile) call [XXX_ProcessRequestDeleteFile](#) after the full length check.]()

[SWS_Dcm_01452] [The [Dcm](#) shall process RequestFileTransfer according to [5] and, in case of modeOfOperation equal to 0x03 (ReplaceFile) call [XXX_ProcessRequestReplaceFile](#) after the full length check.]()

[SWS_Dcm_01453] [The [Dcm](#) shall process RequestFileTransfer according to [5] and, in case of modeOfOperation equal to 0x04 (ReadFile) call [XXX_ProcessRequestReadFile](#) after the full length check.]()

[SWS_Dcm_01454] [The [Dcm](#) shall process RequestFileTransfer according to [5] and, in case of modeOfOperation equal to 0x05 (ReadDir) call [XXX_ProcessRequestReadDir](#) after the full length check.]()

[SWS_Dcm_01088] [If any of the file transfer operations [XXX_ProcessRequest<yyy>](#) returns value [E_NOT_OK](#), the [Dcm](#) module shall send a negative response with [NRC](#) code equal to the parameter [ErrorCode](#) parameter value.]()

[SWS_Dcm_01455] [The [Dcm](#) shall use the value configured in [DcmRequestFileTransferFileSizeOrDirInfoParameterLength](#) as value sent in [fileSizeOrDirInfoParameterLength](#) in the response.]()

[SWS_Dcm_01090] [The [Dcm](#) shall use the value configured in [DcmRequestFileTransferFileSizeOrDirInfoParameterLength](#) as number of bytes sent in [fileSizeUncompressedOrDirInfoLength](#) and [fileSizeCompressed](#) in the response.]()

[SWS_Dcm_01456] [The [Dcm](#) shall use the value configured in [DcmRequestFileTransferLengthFormatIdentifier](#) as value sent in [lengthFormatIdentifier](#) in the response.]()

[SWS_Dcm_01091] [The [Dcm](#) shall use the value configured in [DcmRequestFileTransferLengthFormatIdentifier](#) as number of bytes sent in [maxNumberOfBlockLength](#) in the response.]()

[SWS_Dcm_01457] [If the [maxNumberOfBlockLength](#) does not fit into the requested [lengthFormatIdentifier](#) number of bytes, the [Dcm](#) shall send [NRC](#) 0x10 (generalReject).]()

[SWS_Dcm_01458] [If the [fileSizeUncompressedOrDirInfoLength](#) or [fileSizeCompressed](#) do not fit into the requested [fileSizeOrDirInfoParameterLength](#) number of bytes, the [Dcm](#) shall send [NRC](#) 0x10 (generalReject).]()

7.6.2.24 Service 0x85 - ControlDTCSetting

An external test tool can request an ECU to either disable or enable **DTC** storage in the ECUs error memory by sending a **UDS** Service 0x85 request with sub-function 0x01 ("ON") or 0x02 ("OFF").

[SWS_Dcm_00249] [The **Dcm** module shall implement **UDS** Service ControlDTCSetting (0x85) to enable or disable the storage of **DTCs** in the ECUs error memory.] (*RS_Diag_04159*)

[SWS_Dcm_01399] [If the **Dcm** receives a ControlDTCSetting (0x85) service with DTCSettingControlOptionRecord != 0xFFFFFFF, the **Dcm** shall send a **NRC** 0x31 (RequestOutOfRange).] (*RS_Diag_04159*)

[SWS_Dcm_01063] [On reception of **UDS** Service 0x85 with subfunction 0x01 (DTC-SettingType "ON"), the **Dcm** shall call **Dem_EnableDTCSetting()** with ClientId = Client Id for this **Dcm** instance (see **DcmDemClientRef**).] (*RS_Diag_04115*)

[SWS_Dcm_00783] [In case of **Dem_EnableDTCSetting** returns **E_OK** (see **[SWS_Dcm_01063]**), the **Dcm** shall invoke a mode switch of the **ModeDeclarationGroupPrototype** **DcmControlDTCSetting** by calling **SchM_Switch_<bsnp>_DcmControlDTCSetting** (**RTE_MODE_DcmControlDTCSetting_ENABLEDTCSETTING**).] ()

[SWS_Dcm_00406] [On reception of **UDS** Service 0x85 with subfunction 0x02 (DTC-SettingType "OFF"), the **Dcm** shall call **Dem_DisableDTCSetting()** with ClientId = Client Id for this **Dcm** instance (see **DcmDemClientRef**).] (*RS_Diag_04115*)

[SWS_Dcm_00784] [In case of **Dem_DisableDTCSetting** returns **E_OK** (see **[SWS_Dcm_00406]**), the **Dcm** shall invoke a mode switch of the **ModeDeclarationGroupPrototype** **DcmControlDTCSetting** by calling **SchM_Switch_<bsnp>_DcmControlDTCSetting** (**RTE_MODE_DcmControlDTCSetting_DISABLEDTCSETTING**).] ()

[SWS_Dcm_00751] [In case the **DTCSetting** is disabled and a transitions to default session or upon any diagnostic session change where the new session does not support **UDS** Service **ControlDTCsetting** anymore, the **Dcm** module shall call **Dem_EnableDTCSetting()** with the following parameters

- ClientId: Client Id for this **Dcm** instance (see **DcmDemClientRef**)

and switch the mode **DcmControlDTCSetting** to **DCM_ENABLEDTCSETTING**.] ()

For some use-cases the **Dcm** may re-enable the **controlDTCsetting** due to external changed mode conditions:

[SWS_Dcm_00752] [In case the **DTCSetting** is disabled and at least one referenced arbitrary **ModeDeclarationGroupPrototypes** (see configuration parameter **DcmDspControlDTCSettingReEnableModeRuleRef**) for service **ControlDTCSetting** (0x85) with **DTCSettingType** "OFF" (0x02) are not fulfilled anymore, the **Dcm** module shall call **Dem_EnableDTCSetting()** with the following parameters:

- ClientId: Client Id for this [Dcm](#) instance (see [DcmDemClientRef](#))

and switch the mode [DcmControlDTCSetting](#) to [DCM_ENABLEDTCSETTING](#)]()

Note: If at least one ModeDeclarationGroupPrototypes is configured (see configuration parameter [DcmDspControlDTCSettingReEnableModeRuleRef](#)) for service ControlDTCSetting (0x85) with DTCSettingType "OFF" (0x02), it is recommended to activate the condition check for the according sub-function 0x02(see configuration parameter [DcmDsdSubServiceModeRuleRef](#)).

Note: This active observation of the referenced mode declaration groups can either be achieved by polling the mode condition in each MainFunction cycle or by attaching to the change notification of mode declaration group (SchM will trigger a BSWEntity in [Dcm](#) on changes of this mode declaration group).

[SWS_Dcm_00829] [If the configuration parameter [DcmSupportDTCSettingControlOptionRecord](#) is set to true and the length of DTCSettingControlOptionRecord in the request is different from 3 bytes, the [Dcm](#) shall return NRC 0x13 (Incorrect message length or invalid format).]()

[SWS_Dcm_00852] [If the configuration parameter [DcmSupportDTCSettingControlOptionRecord](#) is set to false and the request contains any data after the sub-function, the [Dcm](#) shall return NRC 0x13 (Incorrect message length or invalid format).]()

[SWS_Dcm_01564] [If the configuration parameter [DcmSupportDTCSettingControlOptionRecord](#) is set to false and the request contains any data after the sub-function, the [Dcm](#) shall return NRC 0x13 (Incorrect message length or invalid format).]()

7.6.2.25 Service 0x87 - LinkControl

This service is used to gain bus bandwidth for diagnostic purposes.

The Service LinkControl (0x87) is user optional. There are different project specific use cases which are not handled in the default Dcm. One use case is to switch the bandwidth in application an other use case performs an OEM bootloader jump.

Therefore the service LinkControl needs to be implemented project specific as external service (refer to Chapter [8.8 Dcm](#) as Service-Component).

7.6.3 OBD Services

7.6.3.1 Overview

The following table defines the [OBD](#) Services supported by the DCM.

Relevant OBD Service Identifier	Support in the DCM
\$01	Supported
\$02	Supported
\$03	Supported
\$04	Supported
\$06	Supported
\$07	Supported
\$08	Supported
\$09	Supported
\$0A	Supported

Table 7.32: Support for **OBD** services in the DCM

7.6.3.2 General behavior

In many cases, the **Dcm** protocol allows the bundling of several requests (for example several "PIIDs") and the corresponding bundling of the responses. The descriptions of the behavior for the individual services do not explicitly consider this. As the **Dcm** needs to comply with **OBD** standard (as is defined through various requirements below), the **Dcm** might need to repeat the steps defined below to parse a request and assemble a valid response.

In a vehicle there can be 3 different types of **OBD** ECUs:

- Master ECU (one per vehicle)
- Primary ECU (several per vehicle)
- Dependent / Secondary ECUs (several per vehicle)

From the Basic Software point of view Dependent / Secondary ECUs doesn't need any specific **OBD** functionality. In Dependent / Secondary ECUs OBD-relevant information will not be stored in the Basic Software (e.g. no direct communication with the scan tool). The respective **OBD** functionality might be handled in Dependent / Secondary ECUs by a SWC.

The following **OBD** requirements are only valid for Master and Primary ECUs. If necessary the **OBD** requirements differentiate between Master and Primary Requirement.

The following table gives an overview about which **OBD** functionality must be supported in a Master ECU, Primary ECU or Dependent / Secondary ECU:

Functionality	Master ECU	Primary ECU	Dependent / Secondary ECU
OBD Scantool Communication	Yes	Yes	No

Table 7.33: Overview about **OBD** functionality in different **OBD** ECUs

[SWS_Dcm_00077] [When calling the DEM module for [OBD](#) services, the [Dcm](#) module shall use the following values for the parameter [DTCOrigin](#):
Service \$0A uses [DEM_DTC_ORIGIN_PERMANENT_MEMORY](#)
All other services use [DEM_DTC_ORIGIN_OBD_RELEVANT_MEMORY](#)] ([RS_Diag_04058](#))

7.6.3.3 Service \$01 - Request Current Powertrain Diagnostic Data

[SWS_Dcm_00243] [The [Dcm](#) module shall implement the [OBD](#) service \$01 (Request Current Powertrain diagnostic Data) in compliance to all provisions of the [OBD](#) standard.]()

Using Service \$01, an external test tool can request an emission-related ECU to return PID-values or to return the supported PIDs. [OBD](#) reserves certain PIDs for the special purpose of obtaining the list of available PIDs in a certain range. These PIDs are called "availability PIDs" and are \$00, \$20, \$40, \$60, \$80, \$A0, \$C0 and \$E0.

The [Dcm](#) collects the [PID](#) information from 1 to n SW-Cs. This applies in particular for PIDs which contain several data values for potentially different sources. Example: PID\$83 reports Nox Sensor Data for sensor 1 and sensor 2 in one composed [PID](#) which might come from different SW-C.

The [Dcm](#) configuration defines the PIDs that are available on the ECU. The [Dcm](#) configuration defines for each such PID:

- The [PID](#) Identifier (see configuration parameter [DcmDspPidIdentifier](#))
- Indication of the [PID](#) is used or not (for postbuild configuration) (see configuration parameter [DcmDspPidUsed](#))
- The size of the [PID](#) (see configuration parameter [DcmDspPidSize](#))
- The supported information for this [PID](#) (see configuration parameter [DcmDspPidSupportInfo](#))
- List of data ([DcmDspPidData](#)) for the [PID](#) with the following configuration for every data
 - The length of the data associated with the [PID](#) (see configuration parameter [DcmDspPidDataByteSize](#))
 - The position of the data in the [PID](#) (see configuration parameter [DcmDspPidByteOffset](#))
 - The reference to the supported information container (see configuration parameter [DcmDspPidDataSupportInfo](#))
 - The [Xxx_ReadData\(\)](#) function that the [Dcm](#) must call to obtain the current value of the data or the name of the port that the [Dcm](#) uses to obtain the

current value through the [RTE](#) from a [SW-C](#) (see configuration parameters [DcmDspPidDataReadFnc](#) and [DcmDspPidDataUsePort](#))

[SWS_Dcm_00407] [On reception of an [OBD](#) Service \$01 request with only "availability PIDs" as parameter, the [Dcm](#) shall respond with the corresponding supported (=configured) PIDs encoded according to the [OBD](#) standard.]()

To obtain the value for a PID, the [Dcm](#) uses the configured [Xxx_ReadData\(\)](#) functions for every data of the PID. To provide [OBD](#) Service \$01, the [Dcm](#) relies on external functions that allow it to obtain the value of the PIDs. There is one such function per data of every [PID](#) that is needed by the DCM.

When using a [Xxx_ReadData\(\)](#) function, the [Dcm](#) provides a buffer of the correct length, which is filled by the function with the data [PID](#) value.

[SWS_Dcm_00408] [On reception of an [OBD](#) Service \$01 request with only PIDs that are not "availability PIDs", the [Dcm](#) shall obtain the current value of these PIDs by invoking the configured [Xxx_ReadData\(\)](#) functions for every data of the [PID](#) and shall return these values as response to Service \$01.]()

[SWS_Dcm_00943] [On reception of an [OBD](#) Service \$01 request with a mixure of "availability PIDs" and not "availability PIDs", this request shall be ignored by the [Dcm](#).]()

The entity providing the actual implementation of the [Xxx_ReadData\(\)](#) function for a specific signal of a [PID](#) might be a [SW-C](#) or another basic software module. The origin of the function is not known to the [Dcm](#) but is part of the [Dcm](#) configuration. Some PIDs are provided by the DEM. These PIDs are also explicitly configured in the [Dcm](#) configuration and it is the responsibility of a correct [Dcm](#) configuration to make the [Xxx_ReadData\(\)](#) function point to the correct function provided by the DEM.

[SWS_Dcm_CONSTR_6069] Dependency for [DcmDspPidDataReadFnc](#) [[DcmDspPidDataReadFnc](#) shall be only present if [DcmDspPidDataUsePort](#) is set to [USE_DATA_SYNCH_FNC](#).]()

For certain PIDs, the [Dem](#) provides the function to obtain the [PID](#) value. Which [PIDs](#) come from the [Dem](#) are part of the [Dcm](#) configuration.

Note: For PIDs where [Dem](#) provides the function, [DcmDspPidDataUsePort](#) for that [PID](#) should be set to [USE_DATA_SYNCH_FNC](#) and [DcmDspPidDataReadFnc](#) shall point to the function [Dem_DcmReadDataOfPID<NN>](#) where <NN> represents the Id of the [PID](#).

The data byte A of the PIDs contain the support status of the subsequent data bytes. Since not all data values might be available due to the particular vehicle configuration (e.g. there is only a Nox-sensor 1 available in the vehicle in the example above), the [PID](#) response contains in this data byte A the information about the support status of the following data values. Note, that the PIDs always contain the same number of bytes - even if not all values are really available.

[SWS_Dcm_00621] [If a [PID](#) contains support information (presence of [DcmDspPid-DataSupportInfo](#) container) the [Dcm](#) shall add the support information in the diagnostic response.]()

[SWS_Dcm_00622] [If a [PID](#) contains support information (presence of [DcmDspPid-DataSupportInfo](#) container) the [Dcm](#) shall calculate the support information value according to the available data for this PID: for every [DcmDspPidData](#) container existing for this PID, the associated support information bits, referenced in [DcmDspPid-DataSupportInfo](#), shall be set to one]()

The response to the OBD-tester needs to be composed out of the available data values. Data bytes that are not provided by an [SW-C](#) need to be replaced with fill-byte to obtain a complete [PID](#) contents.

[SWS_Dcm_00623] [When responding to [OBD](#) Service \$01, the [Dcm](#) shall put fill-bytes between [DcmDspPidData](#) in the [PID](#) whenever content bytes are missing in order to fit to the [PID](#) size (see configuration parameter [DcmDspPidSize](#)).]()

[SWS_Dcm_00944] [The [Dcm](#) shall set the fill bytes to 0x00.]()

Note: If other fill-bytes than 0x00 are needed by legislation, the application has to provide the value of the fill-byte.

[SWS_Dcm_00718] [To serialize the required AUTOSAR data types (signed- and unsigned integer) into the response message of [OBD](#) Service \$01 responses the target endianness configured in [DcmDspPidDataEndianness](#) shall be considered for [DcmDspPidData](#) elements having [DcmDspPidDataUsePort](#) set to [USE_DATA_SENDER_RECEIVER](#) or [USE_DATA_SENDER_RECEIVER_AS_SERVICE](#). In case [DcmDspPidDataEndianness](#) is not present, the [DcmDspDataDefaultEndianness](#) shall be used instead.]()

[SWS_Dcm_CONSTR_6068] Dependency for [DcmDspPidDataEndianness](#) [In case [DcmDspPidDataEndianness](#) is not present, the [DcmDspDataDefaultEndianness](#) shall be used instead.]()

7.6.3.4 Service \$02 - Request Power Train FreezeFrame Data

[SWS_Dcm_00244] [The [Dcm](#) shall implement [OBD](#) Service \$02 (Request Power Train FreezeFrame Data) in compliance to all provisions of the [OBD](#) standard.]()

For OBD-relevant FreezeFrames AUTOSAR only supports frame 0, which is the minimum required by legislation.

[SWS_Dcm_00409] [The [Dcm](#) shall ignore all requests regarding record-numbers that are not 0]()

[SWS_Dcm_00972] [On reception of an [OBD](#) Service \$02 request with a mixture of "availability [PIDs](#)" and not "availability [PIDs](#)", this request shall be ignored by the [Dcm](#).]()

[SWS_Dcm_00973] [When responding to [OBD](#) Service \$02, the [Dcm](#) shall put fill-bytes between [DcmDspPidData](#) in the [PID](#) whenever content bytes are missing in order to fit to the [PID](#) size (see configuration parameter [DcmDspPidSize](#)).]()

[SWS_Dcm_00974] [The [Dcm](#) shall set the fill bytes to 0x00.]()

Note: If other fill-bytes than 0x00 are needed by legislation, the application has to provide the value of the fill-byte.

The following sections define how specific [PIDs](#) are handled by the [Dcm](#).

7.6.3.4.1 Service \$02 - PID\$02

An external tester can request the [DTC](#) that caused a FreezeFrame to be stored by using the Service \$02 with the [PID](#) value \$02.

[SWS_Dcm_00279] [On reception of a request for Service \$02 with [PID](#) \$02, the [Dcm](#) shall call [Dem_DcmGetDTCOfOBDFreezeFrame\(\)](#) with FrameNumber set to 0x00 to get the [DTC](#) number.] ([RS_Diag_04058](#))

The [Dem](#) module returns the corresponding [DTC](#). Note that this 2-byte [DTC](#) is packed into the 4-byte data returned by the call to [Dem_DcmGetDTCOfOBDFreezeFrame\(\)](#). see [Dem](#) specification on how this is done.

[SWS_Dcm_01061] [If [Dem_DcmGetDTCOfOBDFreezeFrame](#) returns [E_NOT_OK](#), the [Dcm](#) shall answer positively with \$0000 (indicates no stored freeze frame data).]()

7.6.3.4.2 Service \$02 - availability PID

Using Service \$02, an external tester may request the supported [PIDs](#) for a specific freeze-frame by using the "availability [PIDs](#)".

[SWS_Dcm_00284] [On reception of a service \$02 request with an "availability [PID](#)", the [Dcm](#) shall respond with the corresponding supported (=configured) [PIDs](#) encoded according to the [OBD](#) standard.]()

7.6.3.4.3 Service \$02 - other PIDs

Using Service \$02, an external tester may request the values of specific PIDs in specific FreezeFrames.

[SWS_Dcm_00286] [On reception of a service \$02 request with a [PID](#) that is not an "availability [PID](#)" and is not \$02, the [Dcm](#) shall call [Dem_DcmReadDataOfOBDFreezeFrame\(\)](#) for every data of the [PID](#) with the following parameter values:

- [PID](#) = the [PID](#) received in the [OBD](#) request

- DestBuffer = a buffer in which the callee can write the value of the [PID](#)
- BufSize = the size of the DestBuffer, this must be at least equal to the size needed to store the value of the [PID](#) as configured in the DCM
- DataElementIndexOfPid = implicit index (from 0 to n) of the DataElement calculated by [Dcm](#) according to the order of the DataElement positions in the [PID](#) (see parameter [DcmDspPidByteOffset](#))

]()

Note that is not necessary for the [Dcm](#) module to lock or unlock the record updates of the [Dem](#) module.

[SWS_Dcm_00287] [Upon the completion of [\[SWS_Dcm_00286\]](#), the [Dcm](#) shall generate a response message including the respective [PID](#), FreezeFrame Number and the associated data record for the requested FreezeFrame number.]()

[SWS_Dcm_01252] [If [Dem_DcmReadDataOfOBDFreezeFrame\(\)](#) returns [E_NOT_OK](#) and a single [PID](#) is requested, the [Dcm](#) shall not provide any answer.]()

[SWS_Dcm_01253] [If [Dem_DcmReadDataOfOBDFreezeFrame\(\)](#) returns [E_NOT_OK](#) and all [PIDs](#) from the requested multiple [PID\(s\)](#) are not supported, the [Dcm](#) shall not provide any answer.]()

[SWS_Dcm_01254] [If [Dem_DcmReadDataOfOBDFreezeFrame\(\)](#) returns [E_NOT_OK](#) and at least one [PID](#) from the requested multiple [PID\(s\)](#) is supported, the [Dcm](#) shall send a positive response including the data of the supported [PID\(s\)](#).]()

7.6.3.5 Service \$03 \$07 \$0A - Obtaining DTCs

[SWS_Dcm_00245] [The [Dcm](#) module shall implement [OBD](#) Service \$03 (Request emission-related diagnostic trouble codes) in compliance to all provisions of the [OBD](#) standard.]()

[SWS_Dcm_00410] [The [Dcm](#) module shall implement [OBD](#) Service \$07 (Request Emission-Related Diagnostic Trouble Codes Detected during Current or Last Completed Driving Cycle) in compliance to all provisions of the [OBD](#) standard.]()

[SWS_Dcm_00411] [The [Dcm](#) module shall implement [OBD](#) Service \$0A (Request Emission-Related Diagnostic Trouble Codes with Permanent Status) in compliance to all provisions of the [OBD](#) standard.]()

An external test tool can request an emission-related ECU to report all stored, pending or permanent emission-related DTCs by sending the request \$03, \$07, \$0A respectively.

[SWS_Dcm_00289] [When receiving a request for [OBD](#) Service \$03, the [Dcm](#) module shall obtain from the DEM all DTCs in primary memory and with a "confirmed" status using the functions [Dem_SetDTCFilter\(\)](#) and [Dem_GetNextFilteredDTC\(\)](#).]()

Note: The [Dcm](#) module can get an indication of the number of records that will be found using [Dem_GetNextFilteredDTC\(\)](#) by using [Dem_GetNumberOfFilteredDTC\(\)](#). This allows the implementation to calculate the total size of the response before cycling through the DTCs.

[SWS_Dcm_00412] [When receiving a request for [OBD](#) Service \$07, the [Dcm](#) module shall obtain from the DEM module all DTCs in primary memory with a "pending" status using the functions [Dem_SetDTCFilter\(\)](#) and [Dem_GetNextFilteredDTC\(\)](#).]()

Note: The [Dcm](#) module can get an indication of the number of records that will be found using [Dem_GetNextFilteredDTC\(\)](#) by using [Dem_GetNumberOfFilteredDTC\(\)](#). This allows the implementation to calculate the total size of the response before cycling through the DTCs.

[SWS_Dcm_00330] [When receiving a request for [OBD](#) Service \$0A, the [Dcm](#) module shall obtain from the DEM all DTCs stored in permanent memory using the functions [Dem_SetDTCFilter\(\)](#) and [Dem_GetNextFilteredDTC\(\)](#).]()

Note: The [Dcm](#) module can get an indication of the number of records that will be found using [Dem_GetNextFilteredDTC\(\)](#) by using [Dem_GetNumberOfFilteredDTC\(\)](#). This allows the implementation to calculate the total size of the response before cycling through the DTCs.

The following table illustrates the parameters the [Dcm](#) module must use when calling [Dem_SetDTCFilter\(\)](#) in response to a request for [OBD](#) Service \$03, \$07 or \$0A.

Parameters to Dem_SetDTCFilter			
OBD Service	\$03	\$07	\$0A
ClientId	Client Id for this Dcm instance (see DcmDemClientRef)	Client Id for this Dcm instance (see DcmDemClientRef)	Client Id for this Dcm instance (see DcmDemClientRef)
DTCStatusMask	0x08 (confirmed bit set)	0x04(pending bit set)	0x00
DTCFormat	DEM_DTC_FORMAT_OBD	DEM_DTC_FORMAT_OBD	DEM_DTC_FORMAT_OBD
DTCOrigin	DEM_DTC_ORIGIN_OBD_RELEVANT_MEMORY	DEM_DTC_ORIGIN_OBD_RELEVANT_MEMORY	DEM_DTC_ORIGIN_PERMANENT
FilterWithSeverity	DEM_FILTER_WITH_SEVERITY_NO	DEM_FILTER_WITH_SEVERITY_NO	DEM_FILTER_WITH_SEVERITY_NO
DTCSeverityMask	Not relevant	Not relevant	Not relevant
FilterForFaultDetectionCounter	DEM_FILTER_FOR_FDC_NO	DEM_FILTER_FOR_FDC_NO	DEM_FILTER_FOR_FDC_NO

Table 7.34: [Dem_SetDTCFilter](#) Parameters

When using paged buffer mechanism, in some case, it's possible that the number of [DTC](#) matching the filter change between the calculation of the total size, needed for

the first page transmission, and the sending of the further pages. For this reason, the requirement [\[SWS_Dcm_00587\]](#) and [\[SWS_Dcm_00588\]](#) shall be considered for the implementation of this service.

[SWS_Dcm_01227] [Dem_GetNextFilteredDTC returns DEM_NO SUCH ELEMENT and at least one matching element could be retrieved before, the [Dcm](#) shall send a positive response including these data elements and the number of DTCs.]()

[SWS_Dcm_01228] [If Dem_GetNextFilteredDTC returns DEM_NO SUCH ELEMENT and no matching element could be retrieved before, the [Dcm](#) shall send a positive response with the number of DTCs set to 0x00.]()

7.6.3.6 Service \$04 - Clear/reset emission-related diagnostic information

[SWS_Dcm_00246] [The [Dcm](#) module shall implement [OBD](#) Service \$04 (Clear/reset emission-related diagnostic information) in compliance to all provisions of the [OBD](#) standard.]()

An external test tool can request an emission-related ECU to clear the error memory by sending the request \$04.

[SWS_Dcm_00004] [When receiving a request for [OBD](#) Service \$04, the [Dcm](#) module shall call the interface Dem_SelectDTC with the following parameter values:

- ClientId: Client Id for this [Dcm](#) instance (see [DcmDemClientRef](#))
- [DTC](#) = DEM_DTC_GROUP_ALL_DTCs
- [DTCFormat](#) = DEM_DTC_FORMAT_OBD
- [DTCOrigin](#) = DEM_DTC_ORIGIN_OBD_RELEVANT_MEMORY

] ([RS_Diag_04058](#))

[SWS_Dcm_00413] [In case Dem_ClearDTC() returns E_OK, the [Dcm](#) module shall send a positive response.]()

[SWS_Dcm_00703] [In case Dem_ClearDTC() returns DEM_PENDING, the [Dcm](#) shall invoke Dem_ClearDTC() on next [Dcm_MainFunction](#) call again. It is up to the [Dcm](#) to send [NRC](#) 78 (ResponsePending) to respect the response behaviour] ([RS_Diag_04249](#))

[SWS_Dcm_00704] [In case Dem_ClearDTC() returns DEM_CLEAR_FAILED, the [Dcm](#) shall send a negative response 0x22 (conditionsNotCorrect).]()

[SWS_Dcm_00967] [In case Dem_ClearDTC() returns DEM_CLEAR_BUSY, the [Dcm](#) shall send a negative response 0x22 (ConditionsNotCorrect).]()

[SWS_Dcm_01067] [In case Dem_ClearDTC() returns DEM_CLEAR_MEMORY_ERROR, the [Dcm](#) module shall send a negative response 0x22 (ConditionNotCorrect).]()

7.6.3.7 Service \$06 - Request On-Board Monitoring Test-results for Specific Monitored Systems

7.6.3.7.1 General requirements

[SWS_Dcm_00414] [The [Dcm](#) module shall implement [OBD](#) Service \$06 (Request On-Board Monitoring Test-results for Specific Monitored Systems) in compliance to all provisions of the [OBD](#) standard.]()

Using Service \$06, an external test tool can request an emission-related ECU to return the DTR's associated with the OBDMID or to return the supported OBDMIDs. [OBD](#) reserves certain OBDMIDs for the special purpose of obtaining the list of supported OBDMIDs in a certain range. These OBDMIDs are called "availability OBDMIDs" and are \$00, \$20, \$40, \$60, \$80, \$A0, \$C0 an \$E0.

A tester request for supported OBDMIDs may contain up to six (6) "availability OBDMIDs".

[SWS_Dcm_00945] [On reception of an [OBD](#) Service \$06 request with "availability OBDMIDs" together with other OBDMIDs as parameter, the [Dcm](#) module shall ignore the request.]()

[SWS_Dcm_00956] [On reception of an [OBD](#) Service \$06 request with multiple non-availability OBDMIDs, the [Dcm](#) module shall ignore the request.]()

7.6.3.7.2 Test results obtained via [Dem](#) interaction

The maintenance of the DTRs lies within the responsibility of the DEM. SW-Cs reporting DTRs use dedicated interfaces offered by the DEM. Upon requests from the tester the [Dcm](#) retrieves the information from the DEM using dedicated DEM interfaces. There is no direct interaction between the [Dcm](#) and SW-Cs.

[SWS_Dcm_00957] [On reception of an [OBD](#) Service \$06 request with only "availability OBDMID(s)" as parameter(s), the [Dcm](#) module shall obtain the supported OBDMIDs by calling the [Dem](#) interface Dem_DcmGetAvailableOBDMIDs() for each "availability OBDMID (\$00, \$20, ...)" contained within the request and concatenate the results within the response message according to ISO-15031-5 [2].]()

[SWS_Dcm_00958] [On reception of an [OBD](#) Service \$06 request with an OBDMID that is not an "availability OBDMID", the [Dcm](#) module shall call the DEM interface Dem_DcmGetNumTIDsOfOBDMID() to obtain the TIDs available for the requested OBDMID and then recurrently call the interface Dem_DcmGetDTRData() for the number of reported TIDs to obtain the associated DTR data.]()

7.6.3.8 Service \$08 - Request Control of On-Board System, Test or Component

[SWS_Dcm_00417] [The `Dcm` module shall implement `OBD` Service \$08 (Request Control of On-Board System, Test or Component) in compliance to all provisions of the `OBD` standard.]()

Using Service \$08, an external test tool can control an on-board system, test or component using a TID. `OBD` reserves certain TIDs for the special purpose of obtaining the list of supported TIDs in a certain range. These TIDs are called "availability TIDs" and are \$00, \$20, \$40, \$60, \$80, \$A0, \$C0 and \$E0.

The `Dcm` module's configuration defines the TIDs that are available on the ECU for the purpose of `OBD` Service \$08. The configuration defines for each such TID (see configuration parameter `DcmDspRequestControlTestId`):

- the name of the port the `Dcm` uses to access the `RequestControlServices` interface (see configuration parameter `DcmDspRequestControl1`)
- the number of bytes this function takes as input (see configuration parameter `DcmDspRequestControlInBufferSize`)
- the number of bytes this function writes as output (see configuration parameter `DcmDspRequestControlOutBufferSize`)

To provide `OBD` Service \$08, the `Dcm` relies on external functions configured per TID.

[SWS_Dcm_00418] [On reception of an `OBD` Service \$08 request with one or more "availability TIDs" as parameter, the `Dcm` module shall respond with the corresponding supported (=configured) TIDs.]()

[SWS_Dcm_00947] [On reception of an `OBD` Service \$08 request "availability TIDs" together with other TIDs as parameter, the `Dcm` module shall ignore the request.]()

[SWS_Dcm_00419] [On reception of an `OBD` Service \$08 request with a TID that is not an "availability TID", the `Dcm` module shall invoke the configured `Xxx_RequestControl()` function with the following parameters values: InBuffer: data contained in the `OBD` request (the size of which must correspond to the size configured in the `Dcm` module's configuration) OutBuffer: space in which the `RequestControl` function can store its result (the size of the buffer is taken from the `Dcm` module's configuration).]()

[SWS_Dcm_00420] [After the execution of **[SWS_Dcm_00419]**, the `Dcm` module shall respond to the service request using the data stored by the `RequestControl` function in the OutBuffer.]()

[SWS_Dcm_00948] [As specified in **[3, SAE J1979]**, unused data bytes shall be filled with \$00.]()

[SWS_Dcm_01192] [If `Xxx_RequestControl()` doesn't return `E_OK`, the `Dcm` shall return `NRC_0x22`.]()

7.6.3.9 Service \$09 - Request Vehicle Information

[SWS_Dcm_00421] [The [Dcm](#) module shall implement [OBD](#) Service \$09 (Request Vehicle Information) in compliance to all provisions of the [OBD](#) standard.]()

Using Service \$09, an external test tool can request vehicle information or can obtain lists of supported vehicle information. [OBD](#) reserves certain InfoTypes for the special purpose of obtaining the list of supported InfoTypes in a certain range. These Infotypes are called "availability InfoTypes" and are \$00, \$20, \$40, \$60, \$80, \$A0, \$C0 and \$E0.

The [Dcm](#) module's configuration defines the InfoTypes and associated data that are available on one or several SW-C. The configuration defines for each such InfoType:

- The value of InfoType (see configuration parameter [DcmDspVehInfoInfoType](#))
- For every data of the InfoType:
 - The position of this data in the InfoType (see configuration parameter [DcmDspVehInfoDataOrder](#))
 - the size of the value of the InfoType data (see configuration parameter [DcmDspVehInfoDataSize](#))
 - the function that the [Dcm](#) module must call to obtain the value for this InfoType data OR the port-name through which the [Dcm](#) module can obtain the value for this InfoType data (see configuration parameter [DcmDspVehInfoDataReadFnc](#) and [DcmDspVehInfoDataUsePort](#)).

To provide [OBD](#) Service \$09, the [Dcm](#) relies on external functions that allow it to obtain the value of an InfoType data. There is one such function per InfoType data that is needed by the DCM.

When invoking a `Xxx_GetInfotypeValueData()` function, the [Dcm](#) module provides a buffer of the correct size in which the value of the InfoType data can be stored. The entity providing the actual implementation of the `Xxx_GetInfotypeValueData()` function for a specific InfoType data might be a [SW-C](#) or another basic software module. The origin of the function is part of the [Dcm](#) module's configuration.

Certain InfoTypes needed by the [Dcm](#) to provide Service \$09 are provided by the DEM. This is handled in the [Dcm](#) configuration.

[SWS_Dcm_00422] [On reception of an [OBD](#) Service \$09 request with one or more "availability InfoTypes" as parameter, the [Dcm](#) module shall respond with the corresponding supported (=configured) InfoTypes.]()

[SWS_Dcm_00949] [On reception of an [OBD](#) Service \$09 request "availability InfoTypes" together with other InfoTypes as parameter, the [Dcm](#) module shall ignore the request.]()

[SWS_Dcm_00423] [On reception of an [OBD](#) Service \$09 request for an InfoType that is not an "availability InfoType", the [Dcm](#) module shall obtain the value of this InfoType

by invoking all the configured `Xxx_GetInfoTypeValueData()` function for every data of this InfoType and shall return the value as response to Service \$09.]()

[SWS_Dcm_00684] [In case `DcmDspVehInfoNODIProvResp` is set to FALSE, in addition to collect the available InfoType value contributions from the individual SW-C, the `Dcm` shall compute the data byte `NofDataItems` in the diagnostic response, which defines the number of DataItems included in one InfoType.]()

Note: The Calculation of the Calibration Identification (CAL-ID) and Calibration Verification Number (CVN) is not a BSW Task and will not be handled within the DCM.

[SWS_Dcm_01167] [In case `DcmDspVehInfoNODIProvResp` is set to TRUE, the `Dcm` shall take over the value returned by the provider and report it as `NofDataItems` in the diagnostic response.]()

[SWS_Dcm_CONSTR_6045] [In case the responsibility is on provider side (`DcmDspVehInfoNODIProvResp` is set to TRUE), only one `DcmDspVehInfoData` container shall be allowed.]()

[SWS_Dcm_CONSTR_6046] [In case `DcmDspVehInfoDataUsePort` is set to FALSE and `DcmDspVehInfoDataReadFnc` is set to either `Dem_DcmGetInfoTypeValue08` or `Dem_DcmGetInfoTypeValue0B` then `DcmDspVehInfoNODIProvResp` shall be set to TRUE.]()

Note : The integrator has to make sure that the buffer determined by the `DcmDspVehInfoDataSize` is sufficiently sized to receive the data returned by the provider of the data.

[SWS_Dcm_01191] [If `Xxx_GetInfoTypeValueData()` doesn't return `E_OK` or `E_PENDING`, the `Dcm` shall return `NRC 0x12`.]()

7.6.4 Interaction usecases

The `Dcm` shall be able to manage a jump to the bootloader / jump due to ECURest request. Due to the diversity of possibility to realize this jump, this will be done using callout call.

7.6.4.1 Jump to Bootloader

4 different use cases have been identified for the jump to the bootloader, if all preconditions are fulfilled and assuming the 'suppressPosRspMsgIndicationBit' flag is set to 'false':

1. The application immediately sends a final positive response and then jumps to the bootloader
2. The application first sends a `NRC 0x78` response, then the final positive response and afterwards jumps to the bootloader

3. The application immediately jumps to the bootloader and the bootloader sends the final positive response
4. The application first sends a [NRC](#) 0x78 response, then jumps to the bootloader and the bootloader sends the final positive response

Note: In case the 'suppressPosRspMsgIndicationBit' flag is set to 'true', use case '1' and use case '3' will not issue a positive response.

[SWS_Dcm_00532] [On reception of service DiagnosticSessionControl if the provided session is used to jump to OEM bootloader (parameter [DcmDspSessionForBoot](#) set to DCM_OEM_BOOT or DCM_OEM_BOOT_RESPAPP) the [Dcm](#) shall prepare the jump to the OEM bootloader (see [\[SWS_Dcm_00535\]](#)) by triggering the mode switch of ModeDeclarationGroupPrototype DcmEcuReset to JUMPTOBOOTLOADER.] ([RS_Diag_04098](#))

Note: By this mode switch the [Dcm](#) informs the BswM to prepare the jump to the bootloader.

[SWS_Dcm_00592] [On reception of service DiagnosticSessionControl if the provided session is used to jump to System Supplier bootloader (parameter [DcmDspSessionForBoot](#) set to DCM_SYS_BOOT or DCM_SYS_BOOT_RESPAPP) the [Dcm](#) shall prepare the jump to the System Supplier bootloader (see [\[SWS_Dcm_00535\]](#)) by triggering the mode switch of ModeDeclarationGroupPrototype DcmEcuReset to JUMPTOSYSSUPPLIERBOOTLOADER] ([RS_Diag_04098](#))

Note: By this mode switch the [Dcm](#) informs the BswM to prepare the jump to the bootloader.

[SWS_Dcm_01164] [In case the service DiagnosticSessionControl implies an ECU reset, the [Dcm](#) shall ignore all further requests while that reset is being processed.] ()

[SWS_Dcm_00654] [In case the ModeDeclarationGroupPrototype DcmEcuReset is switched to mode JUMPTOBOOTLOADER or JUMPTOSYSSUPPLIERBOOTLOADER and the configuration parameter [DcmSendRespPendOnRestart](#) is set to TRUE, the [Dcm](#) shall trigger transmission of [NRC](#) 0x78 - RCR-RP.] ([RS_Diag_04098](#), [RS_Diag_04249](#))

Note: This final transmission of [NRC](#) 0x78 before switching to Bootloader shall reload the P2* timeout in the client.

[SWS_Dcm_01175] [In case the ModeDeclarationGroupPrototype DcmEcuReset can not be switched JUMPTOBOOTLOADER or JUMPTOSYSSUPPLIERBOOTLOADER, the [Dcm](#) shall answer negatively to the request with [NRC](#) 0x22 (Conditions not correct).] ()

[SWS_Dcm_00535] [If the jump to bootloader is requested (see [\[SWS_Dcm_00532\]](#), [\[SWS_Dcm_00592\]](#), the configuration parameter [DcmSendRespPendOnRestart](#) is set to TRUE (see [\[SWS_Dcm_00654\]](#)) and the configuration parameter [DcmDspSessionForBoot](#) is set to DCM_OEM_BOOT or DCM_SYS_BOOT, the [Dcm](#) shall call

`Dcm_SetProgConditions` after a successful transmission of `NRC 0x78` (Response pending).] (*RS_Diag_04098*)

This will allow to store all relevant information prior to jumping to the bootloader.

Note: It is up to the software integrator to decide where to store that data. Usually it will be stored in non-volatile memory like e.g. data flash. It is also acceptable to "store" this data in a RAM section which is not initialized out of reset.

[SWS_Dcm_01163] [In the context of a request to jump to the bootloader (see [\[SWS_Dcm_00532\]](#) and [\[SWS_Dcm_00592\]](#)), after `Dcm_SetProgConditions` returns `E_OK` according to [\[SWS_Dcm_00535\]](#), the `Dcm` shall trigger the mode switch of the ModeDeclarationGroupPrototype `DcmEcuReset` to `EXECUTE`.] (*RS_Diag_04098*)

[SWS_Dcm_01177] [If the jump to bootloader is requested (see [\[SWS_Dcm_00532\]](#), [\[SWS_Dcm_00592\]](#)), the configuration parameter `DcmSendRespPendOnRestart` is set to `TRUE` (see [\[SWS_Dcm_00654\]](#)), and the configuration parameter `DcmDspSessionForBoot` is set to `DCM_OEM_BOOT_RESPAPP` or `DCM_SYS_BOOT_RESPAPP`, the `Dcm` shall initiate the final response after a successful transmission of `NRC 0x78` (Response pending).] (*RS_Diag_04098*)

[SWS_Dcm_00995] [If the `NRC 0x78` (Response Pending) response in [\[SWS_Dcm_00535\]](#) is not sent successfully the `Dcm` shall cancel the current request.] ()

[SWS_Dcm_00997] [If the `NRC 0x78` (Response Pending) response in [\[SWS_Dcm_00535\]](#) is not sent successfully no jump to the bootloader shall be performed] ()

Note: If the `NRC 0x78` (Response Pending) response has not been sent correctly the `Dcm` will stay in the application and wait for the next request from the Client.

[SWS_Dcm_01178] [In case the ModeDeclarationGroupPrototype `DcmEcuReset` is switched to mode `JUMPTOBOOTLOADER` or `JUMPTOSYSSUPPLIERBOOTLOADER`, the configuration parameter `DcmSendRespPendOnRestart` is set to `FALSE` and the configuration parameter `DcmDspSessionForBoot` is set to `DCM_OEM_BOOT_RESPAPP` or `DCM_SYS_BOOT_RESPAPP` , the `Dcm` shall initiate the final response] ()

[SWS_Dcm_01179] [In case the final response has been successfully sent according to [\[SWS_Dcm_01177\]](#) or [\[SWS_Dcm_01178\]](#), the `Dcm` shall call `Dcm_SetProgConditions`] ()

[SWS_Dcm_01180] [If `Dcm_SetProgConditions` returns `E_OK` according to [\[SWS_Dcm_01179\]](#), the `Dcm` shall trigger the mode switch of the ModeDeclarationGroupPrototype `DcmEcuReset` to `EXECUTE`.] ()

[SWS_Dcm_01181] [If `Dcm_SetProgConditions` returns `E_NOT_OK` according to [\[SWS_Dcm_01179\]](#), the `Dcm` shall not request any reset, shall not perform the jump to

bootloader, and shall not switch the ModeDeclarationGroupPrototype DcmEcuReset to EXECUTE.]()

[SWS_Dcm_00720] [In case the ModeDeclarationGroupPrototype DcmEcuReset is switched to mode JUMPTOBOOTLOADER or JUMPTOSYSSUPPLIERBOOTLOADER, the configuration parameter `DcmSendRespPendOnRestart` is set to FALSE and the configuration parameter `DcmDspSessionForBoot` is set to DCM_OEM_BOOT or DCM_SYS_BOOT, the `Dcm` shall call `Dcm_SetProgConditions` immediately. (see [SWS_Dcm_00532] and [SWS_Dcm_00592])]()

[SWS_Dcm_00719] [If `Dcm_SetProgConditions` returns E_OK according to [SWS_Dcm_00720], the `Dcm` shall trigger the mode switch of the ModeDeclarationGroupPrototype DcmEcuReset to EXECUTE without sending a NRC 0x78 (Response pending).]()

In case of [SWS_Dcm_00719], the exact response handling depends on the state of the 'suppressPosRspMsgIndicationBit' (TRUE or FALSE) in the request message.

[SWS_Dcm_00715] [If the jump to bootloader is requested (see [SWS_Dcm_00532] and [SWS_Dcm_00592]) and if the call to `Dcm_SetProgConditions` returns E_NOT_OK (see [SWS_Dcm_00535] and [SWS_Dcm_00720]), no further action shall be taken by the `Dcm` and negative response NRC 0x22 (Conditions not correct) shall be returned.]()

7.6.4.2 Jump due to ECURestart

On reception of an ECURestart Service 0x11 request, if the configuration parameter `DcmResponseToEcuReset` is set to AFTER_RESET, the `Dcm` will set the ResponseRequired flag by calling `Dcm_SetProgConditions`.

[SWS_Dcm_01423] Answer to ECURestart request [On reception of an ECURestart Service 0x11 request, if `DcmResponseToEcuReset` is set to AFTER_RESET, the `Dcm` shall answer to EcuReset service after the reset.] ([RS_Diag_04098](#))

[SWS_Dcm_01424] Answer to ECURestart request [On reception of an ECURestart Service 0x11 request, if `DcmResponseToEcuReset` is set to BEFORE_RESET, the `Dcm` shall answer to EcuReset service before the reset.] ([RS_Diag_04098](#))

[SWS_Dcm_01425] Answer to ECURestart request [If the `Dcm` initiates a reset and `DcmSendRespPendOnRestart` is set to TRUE, the `Dcm` shall trigger transmission of NRC 0x78 (Response pending) before the reset.] ([RS_Diag_04098](#), [RS_Diag_04249](#))

7.6.4.3 Jump from Bootloader / ECURestart

[SWS_Dcm_00536] [At `Dcm` initialization, the `Dcm` shall call `Dcm_GetProgConditions` to know if the initialization is the consequence of a jump from the bootloader / ECURestart.] ([RS_Diag_04098](#))

Note: It is the responsibility of the software integrator to ensure that the data contained in `Dcm_ProgConditionsType` is valid when `Dcm_Init` is called. E.g. if this data is stored in non-volatile memory, it may take some time to make it available after an ECU reset. This has to be taken into account when designing the ECU's startup process.

[SWS_Dcm_00537] [If the initialization of the `Dcm` is the consequence of a jump from the bootloader / ECURestart (see [SWS_Dcm_00536]), the `Dcm` shall call `ComM_DCM_ActiveDiagnostic(NetworkId)` to request the ComManager for the full communication mode.]()

[SWS_Dcm_00767] [When the ComM reports full communication to the Dcm, the `Dcm` shall send the Response to the Service Id passed in the `Dcm_ProgConditionsType`.] ([RS_Diag_04098](#))

[SWS_Dcm_00768] [If the initialization of the `Dcm` is the consequence of a jump from the bootloader (see [SWS_Dcm_00536] and the application is updated by an FLASH download (`Dcm_ProgConditionsType.ApplUpdated == True`), the `Dcm` shall call `BswM_Dcm_ApplicationUpdated()` to notify the BswM that the application was updated.]()

7.6.4.4 Flags management

7.6.4.4.1 Jump to Bootloader

[SWS_Dcm_01182] [On reception of a `UDS` Service 0x10 request (Diagnostic Session Control) with subfunction 0x02 (Start Programming Session), the `Dcm` shall set the `ReprogrammingRequest` flag and, if indicated for this service, the `ResponseRequired` flag by calling `Dcm_SetProgConditions`.]()

[SWS_Dcm_01183] [Depending on configuration parameter `DcmDspSessionFor-Boot`, either the application shall send the positive response (if `suppressPosRspMs-gIndicationBit = FALSE`) or after an ECU reset, when the bootloader is started, it shall send a response and clear the `ResponseRequired` flag. In either case, the bootloader shall clear the `ReprogrammingRequest` flag.]()

[SWS_Dcm_01185] [In case that, during jump to Bootloader, the `Dcm_SetProg-Conditions API` returns `E_NOT_OK`, a DET error shall be reported `DCM_E_SET_-PROG_CONDITIONS_FAIL` and normal functionality shall resume.]()

7.6.4.4.2 Jump from Bootloader

After successful reprogramming of the application software, the bootloader will update the `ApplUpdated` flag and the `ResponseRequired` flags.

After an ECU reset, when the newly programmed application is started for the first time, the [Dcm](#) will read the *AppIUpdated* and *ResponseRequired* flag by calling [Dcm_Get_ProgConditions](#). During this function call the *AppIUpdated* and *ResponseRequired* flags are cleared by the integration code.

7.7 Error notification

The Default Error Tracer module is just help for BSW development and integration. It must not be contained inside the production code. The [API](#) is defined, but the functionality can be chosen and implemented according to the development needs (e.g. errors count, send error information via a serial interface to an external logger, and so on).

7.8 Synchronous and Asynchronous implementation

The [Dcm](#) can access data using an R-Port requiring either a synchronous or an asynchronous ClientServerInterface [DataServices_{Data}](#). In the [Dcm](#) SWS, the parameter [DcmDspDataUsePort](#) is set to [USE_DATA_SYNCH_CLIENT_SERVER](#) or [USE_DATA_ASYNCH_CLIENT_SERVER](#) or [USE_DATA_ASYNCH_CLIENT_SERVER_ERROR](#).

In case of [USE_DATA_SYNCH_CLIENT_SERVER](#), the interface shall be compatible with the [Dem](#) interface "DataServices_<Data>" (no OpStatus parameter). The parameter OpStatus and return parameter DCM_E_PENDING shall only be available in case of [USE_DATA_ASYNCH_CLIENT_SERVER](#) or [USE_DATA_ASYNCH_CLIENT_SERVER_ERROR](#).

Note: a [Dcm](#) implementation using [AsynchronousServerCallPoint](#) or [SynchronousServerCallPoint](#) when calling service processors is completely an implementation decision. This only indicates that the operation uses the status of the operation to allow an asynchronous processing by the [SW-C](#) (initiating a request, checking if a request is still pending, or canceling a pending request, see [\[SWS_Dcm_00686\]](#)).

There is no correlation to the operation signature (i.e. existence of OpStatus parameter and DCM_E_PENDING return code) that demands [AsynchronousServerCallPoint](#) or [SynchronousServerCallPoint](#) usage.

[SWS_Dcm_01187] [If an asynchronous interface is used, the [Dcm](#) shall consider the Output data (OUT) only valid after the last call to the interface that returns E_OK.]()

[SWS_Dcm_01188] [If an asynchronous interface is used, the [Dcm](#) shall consider the OUT-parameter ErrorCode only valid after the last call to the interface that returns E_NOT_OK]()

Note : The "last call" to the interface is the call that returns with a value that indicates that processing has finished, i.e. E_OK or E_NOT_OK.

Note : INOUT parameter are a combination of the requirements above, i.e. on each call of the interface the parameters shall have a valid in-value, and the [Dcm](#) considers the out-value valid only after the last call of the interface.

[SWS_Dcm_01189] [If an asynchronous interface is used, the [Dcm](#) shall provide the values originating from the request for the Input data (IN) on every call to the interface.]()

Note: Requirements [\[SWS_Dcm_01187\]](#), [\[SWS_Dcm_01188\]](#) and [\[SWS_Dcm_01189\]](#) do not apply for functions where a deviant behaviour is explicitly specified.

7.9 DID configuration

The configuration of the [Dcm](#) contains a list of supported DIDs which can be configured in two ways:

- The individual [DID](#) configuration, which required one connection (either via a port or a c-function) per configured data element of the respective [DID](#) to access to the data (reading, writing and controlling). The interface [DataServices](#) should be used for each [DID](#) in this case.
- The [DID](#) range configuration, used to handle a set of DIDs sharing the same behavior uniformly in one [SW-C](#) with only one port-connection. The interface [DataServices_DIDRange_{Range}](#) should be used in this case. Using this configuration allows an interface optimization. The following parameters shall be configured in order to use the DIDRange optimization: [DcmDspDidRangeIdentifierLowerLimit](#) and [DcmDspDidRangeIdentifierUpperLimit](#) which delimited the range of the DIDs. [DcmDspDidRangeMaxDataLength](#) and [DcmDspDidRangeHasGaps](#).

[SWS_Dcm_01174] [If [DcmVinRef](#) is configured then the VIN shall be fetched once by the [Dcm](#) during startup by calling [Dcm_GetVin](#).]()

7.9.1 Individual DID

The individual [DID](#) can be configured in [DcmDspDid](#). A unique [DID](#) identifier is configured on 2 bytes in [DcmDspDidIdentifier](#). In case the [DID](#) refers to other [DIDs](#), the link between them can be configured in [DcmDspDidRef](#)². Each [DID](#) allows to access to signal data values (by reading and/or writing). The signal reference (to [DcmDspData](#)) and the position of the data in the diagnostic answer (for reading) or request (for writing) can be configured in [DcmDspDidSignal](#).

The configuration of the data belonging to the [DID](#) can be provided in the container [DcmDspData](#) (ECUC_Dcm_00869). This container collects the following information:

²Overview of [DcmDspDid](#) container is described in chapter [10.2.5.7.1](#)

- The Data endianness of the data belonging to the [DID](#) (ECUC_Dcm_00986: [DcmDspDataEndianness](#))
- The length and the type of the data (ECUC_Dcm_00605: [DcmDspDataByteSize](#), ECUC_Dcm_00985 : [DcmDspDataType](#))
- The interface to be used to access to the data (ECUC_Dcm_00713: [DcmDspDataUsePort](#))
- The NRAM blockId to access the data (ECUC_Dcm_00809 : [DcmDspDataBlockIdRef](#))
- The interfaces to the application in order to :
 - Check if the [DID](#) can be accessed in the current conditions. This can be achieved by checking for each DataElement if the conditions to read the data are satisfied (ECUC_Dcm_00677: [DcmDspDataConditionCheckReadFnc](#) and ECUC_Dcm_00955: [DcmDspDataConditionCheckReadFncUsed](#))
 - Request to freeze the current state of an IOControl (ECUC_Dcm_00674: [DcmDspDataFreezeCurrentStateFnc](#))
 - Get the scaling information of the [DID](#). This can be achieved by getting the scaling information for each DataElement (ECUC_Dcm_00676: [DcmDspDataGetScalingInfoFnc](#))
 - Request the data length of a DataElement (ECUC_Dcm_00671: [DcmDspDataReadDataLengthFnc](#))
 - Read a certain ECU signal (ECUC_Dcm_00824: [DcmDspDataReadEcuSignal](#)).
 - Access in reading or writing to the data (ECUC_Dcm_00669 : [DcmDspDataReadFnc](#), ECUC_Dcm_00670: [DcmDspDataWriteFnc](#))
 - Request to reset an IOControl to default value (ECUC_Dcm_00673 : [DcmDspDataResetToDefaultFnc](#))
 - Request to return control to ECU of an IOControl (ECUC_Dcm_00672 : [DcmDspDataReturnControlToEcuFnc](#))
 - Request to adjust the IO signal (ECUC_Dcm_00675 : [DcmDspDataShortTermAdjustmentFnc](#))

It is also possible to configure an alternative diagnosis representation via ECUC_Dcm_00993: [DcmDspDiagnosisScaling](#).

The following example shows how to configure the containers [DcmDspDid](#) and [DcmDspData](#) for an individual [DID](#) 0xF080. This configuration allows access to a byte of data via synchronous C APIs [WriteDID_F080](#) (for writing) and [ReadDID_F080](#) (for reading).

- `DcmDspDidIdentifier`=0xF080
- `DcmDspDidByteOffset`=0
- `DcmDspDidDataRef`=`DcmDspData_F080`
- `DcmDspDataByteSize`=8
- `DcmDspDataType`=`UINT8_N`
- `DcmDspDataUsePort`=`USE_DATA_SYNCH_FNC`
- `DcmDspDataWriteFnc`=`WriteDID_F080`
- `DcmDspDataReadFnc`=`ReadDID_F080`

[SWS_Dcm_CONSTR_6067] Dependency for `DcmDspDataBlockIdRef` [`DcmDspDataBlockIdRef` shall be only present if `DcmDspDataUsePort` is set to `USE_BLOCK_ID`.]()

7.9.2 DID ranges

`DID` ranges are in general the same as the 'normal' `DID` read and write function, except that the `DID` is also passed as a parameter. This allows to treat the `DID` range in a switch/case in the read or the write function.

The ranges can be applied for reading (ReadDataByIdentifier 0x22) and writing (WriteDataByIdentifier 0x2E) `DID`s.

The ranges can be configured in ECUC_Dcm_00937 : `DcmDspDidRange`. Each configured range is by default accessible by service 0x22 and 0x2E. In case the range should be limited to reading or writing, the referenced `DcmDspDidInfo` container should be defined accordingly.

It is also possible to define gaps within the range (`DcmDspDidRangeHasGaps`). By activating this feature, the `Dcm` invokes each time a `DID` is requested within the configured range, the operation `IsDidAvailable` has to check the current availability. And as the `DID`s of the specified range can have different length, the length of the longest `DID` has to be configured (`DcmDspDidRangeMaxDataLength`) in order to reserve enough buffer passed to the respective function.

In general, the range functionality can also be used for a single `DID` if you specifically want to pass the `DID` as a parameter. Then lower `DID` and upper `DID` should be the same.

`ReadDidRangeDataLength` operation allows to request the application to return the data length of a `DID` Range.

[SWS_Dcm_CONSTR_6020] Definition of allowed `DID` access [Any defined range shall only reference via `DcmDspDidRangeInfoRef`. The sub-containers `DcmDspDidControl` and `DcmDspDidDefineinDcmDspDidInfo` shall not be used] .()

[SWS_Dcm_CONSTR_6021] DID ranges cannot be mapped on DDDIDs, because service 0x2C DDDID does not support the range feature. Practically `DcmDspDidRangeIdentifierLowerLimit` and `DcmDspDidRangeIdentifierUpperLimit` should not include DIDs of the range 0xF200 till 0xF3FF. [Any defined range shall only reference `DcmDspDidInfo` via `DcmDspDidRangeInfoRef`, having set `DcmDspDidDynamicallyDefined == False.`]()

7.10 Startup behavior

[SWS_Dcm_00334] [`Dcm_Init` shall initialize all `Dcm` global variables with the values of the configuration]()

8 API specification

This section defines:

- The syntax and semantics of the functions that are provided and required from other BSW modules. These take the form of "C"-APIs.
- The syntax and semantics of a subset of those functions which are used by software-components through the RTE. These take the form of descriptions using the concepts of the Software-Component Template.

8.1 Imported types

In this chapter all types included from the following files are listed.

[SWS_Dcm_00333] [

<i>Module</i>	<i>Header File</i>	<i>Imported Type</i>
BndM	bndm.h	BndM_BlockIdType
	bndm.h	BndM_ResultType
	bndm_externals.h	BndM_Block{BlockId,Shortname}Type
ComStack	ComStack_Types.h	BufReq_ReturnType
	ComStack_Types.h	NetworkHandleType
	ComStack_Types.h	PdulIdType
	ComStack_Types.h	PduInfoType
	ComStack_Types.h	PduLengthType
	ComStack_Types.h	RetryInfoType

Module	Header File	Imported Type
	ComStack_Types.h	TpDataStateType
Dem	Dem.h	Dem_DTCRequestType
	Dem.h	Dem_DTCSeverityType
	Dem.h	Dem_DTCTranslationFormatType
	Rte_Dem_Type.h	Dem_DTCFormatType
	Rte_Dem_Type.h	Dem_DTCOriginType
	Rte_Dem_Type.h	Dem_UdsStatusByteType
IdsM	IdsM_Types.h	IdsM_SecurityEventIdType
KeyM	Rte_KeyM_Type.h	KeyM_CertificateIdType
	Rte_KeyM_Type.h	KeyM_CertificateStatusType
NvM	Rte_NvM_Type.h	NvM_BlockIdType
SchM	SchM.h	SchM_ReturnType
Std	Std_Types.h	Std_ReturnType
	Std_Types.h	Std_VersionInfoType

」()

8.2 Type definitions

The [Dcm](#) module shall ensure that implementation-specific types are not "visible" outside of Dcm. Otherwise, the complete architecture would be corrupted.

This section lists the types which are defined by the [Dcm](#) SWS.

8.2.1 Dcm_StatusType

[\[SWS_Dcm_00976\]](#) ↗

Name	Dcm_StatusType		
Kind	Type		
Derived from	uint8		
	DCM_E_OK	0x00	This value is representing a successful operation.
	DCM_E_ROE_NOT_ACCEPTED	0x06	ResponseOnOneEvent request is not accepted by DCM (e.g. old ResponseOnOneEvent is not finished) (used at API: Dcm_ResponseOnOneEvent())

	DCM_E_PERIODICID_NOT_ACCEPTED	0x07	Periodic transmission request is not accepted by DCM (e.g. old Periodic transmission is not finished) (used at API: Dcm_ResponseOnOneDataByPeriodicId ())
Description	Base item type to transport status information.		
Available via	Dcm.h		

」()

8.2.2 Dcm_CommunicationModeType

[SWS_Dcm_00981] [

Name	Dcm_CommunicationModeType		
Kind	Type		
Derived from	uint8		
Range	DCM_ENABLE_RX_TX_NORM	0x00	Enable the Rx and Tx for normal communication
	DCM_ENABLE_RX_DISABLE_TX_NORM	0x01	Enable the Rx and disable the Tx for normal communication
	DCM_DISABLE_RX_ENABLE_TX_NORM	0x02	Disable the Rx and enable the Tx for normal communication
	DCM_DISABLE_RX_TX_NORMAL	0x03	Disable Rx and Tx for normal communication
	DCM_ENABLE_RX_TX_NM	0x04	Enable the Rx and Tx for network management communication
	DCM_ENABLE_RX_DISABLE_TX_NM	0x05	Enable Rx and disable the Tx for network management communication
	DCM_DISABLE_RX_ENABLE_TX_NM	0x06	Disable the Rx and enable the Tx for network management communication
	DCM_DISABLE_RX_TX_NM	0x07	Disable Rx and Tx for network management communication
	DCM_ENABLE_RX_TX_NORM_NM	0x08	Enable Rx and Tx for normal and network management communication
	DCM_ENABLE_RX_DISABLE_TX_NORM_NM	0x09	Enable the Rx and disable the Tx for normal and network management communication
	DCM_DISABLE_RX_ENABLE_TX_NORM_NM	0x0A	Disable the Rx and enable the Tx for normal and network management communication
	DCM_DISABLE_RX_TX_NORM_NM	0x0B	Disable Rx and Tx for normal and network management communication
Description	-		

Available via	Dcm.h
----------------------	-------

]()

8.2.3 Dcm_ConfigType

[SWS_Dcm_00982] [

Name	Dcm_ConfigType	
Kind	Structure	
Elements	Implementation specific	
Type	—	
Comment	—	
Description	This type defines a data structure for the post build parameters of the DCM . At initialization the DCM gets a pointer to a structure of this type to get access to its configuration data, which is necessary for initialization.	
Available via	Dcm.h	

]()

8.2.4 Dcm_ReturnReadMemoryType

[SWS_Dcm_00985] [

Name	Dcm_ReturnReadMemoryType		
Kind	Type		
Derived from	uint8		
Range	DCM_READ_OK	0x00	Reading has been done
	DCM_READ_PENDING	0x01	Reading is pending, another call is request to finalize the reading
	DCM_READ_FAILED	0x02	Reading has failed
	DCM_READ_FORCE_RCRRP	0x03	Reading is pending, the Response pending transmission starts immediately
Description	Return values of Callout Dcm_ReadMemory		
Available via	Dcm.h		

]()

8.2.5 Dcm_ReturnWriteMemoryType

[SWS_Dcm_00986] [

Name	Dcm_ReturnWriteMemoryType		
Kind	Type		
Derived from	uint8		
Range	DCM_WRITE_OK	0x00	Writing has been done
	DCM_WRITE_PENDING	0x01	Writing is pending, another called is requested
	DCM_WRITE_FAILED	0x02	The writing has failed
	DCM_WRITE_FORCE_RCRRP	0x03	Writing is pending, the Response pending transmission starts immediately
Description	Return type of callout Dcm_WriteMemory		
Available via	Dcm.h		

)]()

8.2.6 Dcm_EcuStartModeType

[SWS_Dcm_00987] [

Name	Dcm_EcuStartModeType		
Kind	Type		
Derived from	uint8		
Range	DCM_COLD_START	0x00	The ECU starts normally
	DCM_WARM_START	0x01	The ECU starts from a bootloader jump
Description	Allows the DCM to know if a diagnostic response shall be sent in the case of a jump from bootloader		
Available via	Dcm.h		

)]()

8.2.7 Dcm_ProgConditionsType

[SWS_Dcm_00988] [

Name	Dcm_ProgConditionsType		
Kind	Structure		
	ConnectionId		
Type	uint16		
	Comment	Unique id of the connection on which the request has been received	
TesterAddress			
Type	uint16		

▽

△

	Comment	Source address of the received request if meta data is enabled, otherwise the value as configured in DcmDslProtocolRxTesterSourceAddr
	Sid	
	Type	uint8
	Comment	Service identifier of the received request
	SubFncld	
	Type	uint8
	Comment	Identifier of the received subfonction
	ReprogrammingRequest	
	Type	boolean
	Comment	Set to true in order to request reprogramming of the ECU.
	ApplUpdated	
	Type	boolean
	Comment	Indicate whether the application has been updated or not.
	ResponseRequired	
	Type	boolean
	Comment	Set to true in case the flashloader or application shall send a response.
Description	Used in Dcm_SetProgConditions() to allow the integrator to store relevant information prior to jumping to bootloader / jump due to ECURest request.	
Available via	Dcm.h	

↴()

8.2.8 Dcm_MsgItemType

[SWS_Dcm_00989] ↴

Name	Dcm_MsgItemType
Kind	Type
Derived from	uint8
Description	Base type for diagnostic message item
Available via	Dcm.h

↴()

8.2.9 Dcm_MsgType

[SWS_Dcm_00990] ↴

Name	Dcm_MsgType
Kind	Pointer
Type	Dcm_MsgItemType*
Description	Base type for diagnostic message (request, positive or negative response)
Available via	Dcm.h

)]()

8.2.10 Dcm_MsgLenType

[SWS_Dcm_00991] ↴

Name	Dcm_MsgLenType
Kind	Type
Derived from	uint32
Description	Length of diagnostic message (request, positive or negative response). The maximum length is dependent of the underlying transport protocol/media.
Available via	Dcm.h

)]()

8.2.11 Dcm_MsgAddInfoType

Please note that the following table describes a struct type definition - including its struct items "elements".

[SWS_Dcm_00992] ↴

Name	Dcm_MsgAddInfoType	
Kind	Structure	
Elements	reqType	
	Type	bit
	Comment	(Pos LSB+0) 0 = physical request 1 = functional request
suppressPosResponse		
	Type	bit
	Comment	Position LSB+1 0 = no (do not suppress) 1 = yes (no positive response will be sent)

Description	Additional information on message request. Datastructure: Bitfield
Available via	Dcm.h

」()

8.2.12 Dcm_IdContextType

[SWS_Dcm_00993] [

Name	Dcm_IdContextType
Kind	Type
Derived from	uint8
Description	This message context identifier can be used to determine the relation between request and response confirmation.
Available via	Dcm.h

」()

8.2.13 Dcm_MsgContextType

Please note that the following table describes a struct type definition - including its struct items "elements".

[SWS_Dcm_00994] [

Name	Dcm_MsgContextType	
Kind	Structure	
	reqData	
Type	Dcm_MsgType	
Comment	Request data, starting directly after service identifier (which is not part of this data)	
	reqDataLen	
Type	Dcm_MsgLenType	
Comment	Request data length (excluding service identifier)	
	resData	
Type	Dcm_MsgType	
Comment	Positive response data, starting directly after service identifier (which is not part of this data).	
	resDataLen	
Type	Dcm_MsgLenType	

	Comment	Positive response data length (excluding service identifier)
	msgAddInfo	
	Type	Dcm_MsgAddInfoType
	Comment	Additional information about service request and response (see: Dcm_MsgAddInfo)
	resMaxDataLen	
	Type	Dcm_MsgLenType
	Comment	The maximal length of a response is restricted by the size of the buffer. The buffer size can depend on the diagnostic protocol identifier which is assigned to this message, e. g. an OBD protocol id can obtain other properties than the enhanced diagnostic protocol id. The resMaxDataLen is a property of the diagnostic protocol assigned by the DSL. The value does not change during communication. It cannot be implemented as a constant, because it can differ between different diagnostic protocols.
	idContext	
	Type	Dcm_IdContextType
	Comment	This message context identifier can be used to determine the relation between request and response confirmation. This identifier can be stored within the application at request time, so that the response can be assigned to the original request. Background: Within the confirmation, the message context is no more valid, all message data is lost. You need an additional information to determine the request to which this confirmation belongs.
	dcmRxPduld:	
	Type	PduldType
	Comment	Pdu identifier on which the request was received. The Pduld of the request can have consequences for message processing. E. g. an OBD request will be received on the OBD Pduld and will be processed slightly different than an enhanced diagnostic request received on the physical
Description	This data structure contains all information which is necessary to process a diagnostic message from request to response and response confirmation.	
Available via	Dcm.h	

]()

8.2.14 Dcm_ExtendedOpStatusType

[SWS_Dcm_91015] []

Name	Dcm_ExtendedOpStatusType		
Kind	Type		
Derived from	uint8		
	DCM_INITIAL	0x00	Indicates the initial call to the operation
	DCM_PENDING	0x01	Indicates that a pending return has been done on the previous call of the operation

	DCM_CANCEL	0x02	Indicates that the Dcm requests to cancel the pending operation
	DCM_FORCE_RCRRP_OK	0x03	Confirm a response pending transmission Variation
	DCM_POS_RESPONSE_SENT	0x04	Indicates that a positive response has been sent successfully
	DCM_POS_RESPONSE_FAILED	0x05	Indicates that a positive response has not been sent successfully
	DCM_NEG_RESPONSE_SENT	0x06	Indicates that a negative response has been sent successfully
	DCM_NEG_RESPONSE_FAILED	0x07	Indicates that a negative response has not been sent successfully
Description	–		
Available via	Dcm.h

8.3 Function definitions

This section defines the functions provided for other modules.

8.3.1 Functions provided for other BSW components

8.3.1.1 Dcm_Init

[SWS_Dcm_00037] 「

Service Name	Dcm_Init	
Syntax	<pre>void Dcm_Init (const Dcm_ConfigType* ConfigPtr)</pre>	
Service ID [hex]	0x01	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	ConfigPtr	Pointer to configuration set in Variant Post-Build.
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	Service for basic initialization of DCM module.	
Available via	Dcm.h	

」(SRS_BSW_00438, SRS_BSW_00101)

The call of this service is mandatory before using the [Dcm](#) module for further processing.

8.3.1.2 Dcm_GetVersionInfo

[SWS_Dcm_00065] ↴

Service Name	Dcm_GetVersionInfo	
Syntax	<pre>void Dcm_GetVersionInfo (Std_VersionInfoType* versionInfo)</pre>	
Service ID [hex]	0x24	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	versionInfo	Pointer to where to store the version information of this module.
Return value	None	
Description	Returns the version information of this module	
Available via	Dcm.h	

↳(SRS_BSW_00407, SRS_BSW_00482, SRS_BSW_00003)

8.3.1.3 Dcm_DemTriggerOnDTCStatus

[SWS_Dcm_00614] ↴

Service Name	Dcm_DemTriggerOnDTCStatus	
Syntax	<pre>Std_ReturnType Dcm_DemTriggerOnDTCStatus (uint32 DTC, Dem_UdsStatusByteType DTCStatusOld, Dem_UdsStatusByteType DTCStatusNew)</pre>	
Service ID [hex]	0x2B	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	DTC	This is the DTC the change trigger is assigned to.
	DTCStatusOld	DTC status before change
	DTCStatusNew	DTC status after change
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: this value is always returned.
Description	Triggers on changes of the UDS status byte. Allows to trigger on ROE Event for subservice On DTCStatusChanged.	
Available via	Dcm_Dem.h	

↳()

8.3.1.4 Dcm_GetVin

[SWS_Dcm_00950] ↗

Service Name	Dcm_GetVin	
Syntax	<pre>Std_ReturnType Dcm_GetVin (uint8* Data)</pre>	
Service ID [hex]	0x07	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	Data	Pointer to where to store the VIN
Return value	Std_ReturnType	E_OK: The Data pointer has been filled with valid VIN E_NOT_OK: The default VIN will be used in the DoIP
Description	Function to get the VIN (as defined in SAE J1979-DA)	
Available via	Dcm.h	

↘()

Note: After fetching the VIN, the [Dcm](#) can offer the data to all users without worrying that the data is unavailable if a user asks for it. This is necessary because the VIN could not be fetched synchronously for all settings of DcmDspDidDataUsePort.

8.3.1.5 Dcm_BndMWriteBlockFinish

[SWS_Dcm_91088] ↗

Service Name	Dcm_BndMWriteBlockFinish	
Syntax	<pre>void Dcm_BndMWriteBlockFinish (BndM_BlockIdType BlockId, BndM_ResultType result)</pre>	
Service ID [hex]	0x7a	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	BlockId	-
	result	-
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	Called by BndM to indicate that a block write operation has finished.	
Available via	Dcm.h	

↗([RS_Diag_04243](#))

8.3.2 Functions provided to BSW modules and to SW-Cs

The functions defined in this section can also be used by SW-Cs through the RTE.

8.3.2.1 Dcm_SetDeauthenticatedRole

[SWS_Dcm_91069] ↗

Service Name	Dcm_SetDeauthenticatedRole	
Syntax	<pre>Std_ReturnType Dcm_SetDeauthenticatedRole (uint16 connectionId, Dcm_AuthenticationRoleType deauthenticatedRole)</pre>	
Service ID [hex]	0x79	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	connectionId	Unique connection identifier identifying the connection for which a deauthenticated roles is set.
	deauthenticatedRole	New deauthenticated role that is assigned to that connection
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: this value is always returned.
Description	Sets a new role used in deauthenticated state for that connection. The set role is valid until the connection switches into authenticated state or the ECU is reset.	
Available via	Dcm.h	

↘()

8.3.2.2 Dcm_GetSecurityLevel

[SWS_Dcm_00338] ↗

Service Name	Dcm_GetSecurityLevel	
Syntax	<pre>Std_ReturnType Dcm_GetSecurityLevel (Dcm_SecLevelType★ SecLevel)</pre>	
Service ID [hex]	0x0d	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	None	
Parameters (inout)	None	

Parameters (out)	SecLevel	Active Security Level value Conversion formula to calculate SecurityLevel out of tester requested SecurityAccessType parameter: SecurityLevel = (SecurityAccessType + 1) / 2 Content of SecurityAccessType is according to "securityAccessType" parameter of SecurityAccess request (see [11])
Return value	Std_ReturnType	E_OK: this value is always returned.
Description	This function provides the active security level value.	
Available via	Dcm.h	

]([RS_Diag_04005](#), [RS_Diag_04011](#))

8.3.2.3 Dcm_GetSesCtrlType

[[SWS_Dcm_00339](#)] [

Service Name	Dcm_GetSesCtrlType	
Syntax	<pre>Std_ReturnType Dcm_GetSesCtrlType (Dcm_SesCtrlType* SesCtrlType)</pre>	
Service ID [hex]	0x06	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	SesCtrlType	Active Session Control Type value Content is according to "diagnosticSessionType" parameter of DiagnosticSessionControl request (see [11])
Return value	Std_ReturnType	E_OK: this value is always returned.
Description	This function provides the active session control type value.	
Available via	Dcm.h	

]([RS_Diag_04006](#), [RS_Diag_04011](#))

8.3.2.4 Dcm_GetActiveProtocol

[[SWS_Dcm_00340](#)] [

Service Name	Dcm_GetActiveProtocol	
Syntax	<pre>Std_ReturnType Dcm_GetActiveProtocol (Dcm_ProtocolType* ActiveProtocolType, uint16* ConnectionId, uint16* TesterSourceAddress)</pre>	

△

Service ID [hex]	0x0f	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	ActiveProtocolType	Active protocol type value
	ConnectionId	Unique connection identifier
	TesterSourceAddress	source address of the tester
Return value	Std_ReturnType	E_OK: this value is always returned.
Description	This function returns the active UDS protocol details	
Available via	Dcm.h	

↴(RS_Diag_04011)

8.3.2.5 Dcm_ResetToDefaultSession

[SWS_Dcm_00520] ↴

Service Name	Dcm_ResetToDefaultSession	
Syntax	<pre>Std_ReturnType Dcm_ResetToDefaultSession (void)</pre>	
Service ID [hex]	0x2a	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: this value is always returned.
Description	The call to this function allows the application to reset the current session to Default session. Example: Automatic termination of an extended diagnostic session upon exceeding of a speed limit.	
Available via	Dcm.h	

↴()

8.3.2.6 Dcm_TriggerOnEvent

[SWS_Dcm_00521] ↴

Service Name	Dcm_TriggerOnEvent	
Syntax	<pre>Std_ReturnType Dcm_TriggerOnEvent (uint8 RoeEventId)</pre>	
Service ID [hex]	0x2D	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	RoeEventId	Identifier of the event that is triggered
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: RoeEventId value is valid E_NOT_OK: RoeEventId value is not valid
Description	The call to this function allows to trigger an event linked to a ResponseOnEvent request. On the function call, the DCM will execute the associated service if the corresponding Mode of the Roe EventId is 'ROE started'.	
Available via	Dcm.h	

]()

8.3.2.7 Dcm_SetActiveDiagnostic

[SWS_Dcm_01068] [

Service Name	Dcm_SetActiveDiagnostic	
Syntax	<pre>Std_ReturnType Dcm_SetActiveDiagnostic (boolean active)</pre>	
Service ID [hex]	0x56	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	active	If false Dcm shall not call ComM_DCM_ActiveDiagnostic(). If true Dcm will call ComM_DCM_ActiveDiagnostic().
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: this value is always returned.
Description	Allows to activate and deactivate the call of ComM_DCM_ActiveDiagnostic() function.	
Available via	Dcm.h	

]()

8.4 Callback notifications

This section defines the functions provided for lower layer BSW modules.

Figure 8.1: Overview of the callbacks provided by the DCM

8.4.1 Dcm_StartOfReception

[SWS_Dcm_00094] [

Service Name	Dcm_StartOfReception
Syntax	<pre> BufReq_ReturnType Dcm_StartOfReception (PduIdType id, const PduInfoType* info, PduLengthType TpSduLength, PduLengthType* bufferSizePtr) </pre>
Service ID [hex]	0x46
Sync/Async	Synchronous
Reentrancy	Reentrant

Parameters (in)	id	Identification of the I-PDU.
	info	Pointer to a PduInfoType structure containing the payload data (without protocol information) and payload length of the first frame or single frame of a transport protocol I-PDU reception, and the MetaData related to this PDU. If neither first/single frame data nor MetaData are available, this parameter is set to NULL_PTR.
	TpSduLength	Total length of the N-SDU to be received.
Parameters (inout)	None	
Parameters (out)	bufferSizePtr	Available receive buffer in the receiving module. This parameter will be used to compute the Block Size (BS) in the transport protocol module.
Return value	BufReq_ReturnType	BUFREQ_OK: Connection has been accepted. bufferSizePtr indicates the available receive buffer; reception is continued. If no buffer of the requested size is available, a receive buffer size of 0 shall be indicated by bufferSizePtr. BUFREQ_E_NOT_OK: Connection has been rejected; reception is aborted. bufferSizePtr remains unchanged. BUFREQ_E_OVFL: No buffer of the required length can be provided; reception is aborted. bufferSizePtr remains unchanged.
Description	This function is called at the start of receiving an N-SDU. The N-SDU might be fragmented into multiple N-PDUs (FF with one or more following CFs) or might consist of a single N-PDU (SF). The service shall provide the currently available maximum buffer size when invoked with TpSduLength equal to 0. This function might be called in interrupt context.	
Available via	Dcm.h	

]()

By the function [Dcm_StartOfReception](#) the receiver (e.g. DCM) is also informed implicitly about a first frame reception or a single frame reception. If the function [Dcm_StartOfReception](#) returns a return value not equal to BUFREQ_OK, the values of the out parameters are not specified and should not be evaluated by the caller.

8.4.2 Dcm_CopyRxData

[[SWS_Dcm_00556](#)] [

Service Name	Dcm_CopyRxData	
Syntax	<pre>BufReq_ReturnType Dcm_CopyRxData (PduIdType id, const PduInfoType* info, PduLengthType* bufferSizePtr)</pre>	
Service ID [hex]	0x44	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	id	Identification of the received I-PDU.

△

	info	Provides the source buffer (SduDataPtr) and the number of bytes to be copied (SduLength). An SduLength of 0 can be used to query the current amount of available buffer in the upper layer module. In this case, the SduDataPtr may be a NULL_PTR.
Parameters (inout)	None	
Parameters (out)	bufferSizePtr	Available receive buffer after data has been copied.
Return value	BufReq_ReturnType	BUFREQ_OK: Data copied successfully BUFREQ_E_NOT_OK: Data was not copied because an error occurred.
Description	This function is called to provide the received data of an I-PDU segment (N-PDU) to the upper layer. Each call to this function provides the next part of the I-PDU data. The size of the remaining buffer is written to the position indicated by bufferSizePtr. This function might be called in interrupt context.	
Available via	Dcm.h	

↴()

8.4.3 Dcm_TpRxIndication

[SWS_Dcm_00093] ↴

Service Name	Dcm_TpRxIndication	
Syntax	<pre>void Dcm_TpRxIndication (PduIdType id, Std_ReturnType result)</pre>	
Service ID [hex]	0x45	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	id	Identification of the received I-PDU.
	result	Result of the reception.
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	Called after an I-PDU has been received via the TP API, the result indicates whether the transmission was successful or not. This function might be called in interrupt context.	
Available via	Dcm.h	

↴()

8.4.4 Dcm_CopyTxData

[SWS_Dcm_00092] ↴

Service Name	Dcm_CopyTxData	
Syntax	<pre>BufReq_ReturnType Dcm_CopyTxData (PduIdType id, const PduInfoType* info, const RetryInfoType* retry, PduLengthType* availableDataPtr)</pre>	
Service ID [hex]	0x43	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	id info retry	Identification of the transmitted I-PDU.
		Provides the destination buffer (SduDataPtr) and the number of bytes to be copied (SduLength). If not enough transmit data is available, no data is copied by the upper layer module and BUFREQ_E_BUSY is returned. The lower layer module may retry the call. An SduLength of 0 can be used to indicate state changes in the retry parameter or to query the current amount of available data in the upper layer module. In this case, the SduDataPtr may be a NULL_PTR.
		This parameter is used to acknowledge transmitted data or to retransmit data after transmission problems. If the retry parameter is a NULL_PTR, it indicates that the transmit data can be removed from the buffer immediately after it has been copied. Otherwise, the retry parameter must point to a valid RetryInfoType element. If TpDataState indicates TP_CONFPENDING, the previously copied data must remain in the TP buffer to be available for error recovery. TP_DATACONF indicates that all data that has been copied before this call is confirmed and can be removed from the TP buffer. Data copied by this API call is excluded and will be confirmed later. TP_DATARETRY indicates that this API call shall copy previously copied data in order to recover from an error. In this case TxTpDataCnt specifies the offset in bytes from the current data copy position.
Parameters (inout)	None	
Parameters (out)	availableDataPtr	Indicates the remaining number of bytes that are available in the upper layer module's Tx buffer. availableDataPtr can be used by TP modules that support dynamic payload lengths (e.g. FrIsoTp) to determine the size of the following CFs.
Return value	BufReq_ReturnType	BUFREQ_OK: Data has been copied to the transmit buffer completely as requested. BUFREQ_E_BUSY: Request could not be fulfilled, because the required amount of Tx data is not available. The lower layer module may retry this call later on. No data has been copied. BUFREQ_E_NOT_OK: Data has not been copied. Request failed.
Description	This function is called to acquire the transmit data of an I-PDU segment (N-PDU). Each call to this function provides the next part of the I-PDU data unless retry->TpDataState is TP_DATARETRY. In this case the function restarts to copy the data beginning at the offset from the current position indicated by retry->TxTpDataCnt. The size of the remaining data is written to the position indicated by availableDataPtr. This function might be called in interrupt context.	
Available via	Dcm.h	

↴()

8.4.5 Dcm_TpTxConfirmation

[SWS_Dcm_00351] [

Service Name	Dcm_TpTxConfirmation	
Syntax	<pre>void Dcm_TpTxConfirmation (PduIdType id, Std_ReturnType result)</pre>	
Service ID [hex]	0x48	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	id	Identification of the transmitted I-PDU.
	result	Result of the transmission of the I-PDU.
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	This function is called after the I-PDU has been transmitted on its network, the result indicates whether the transmission was successful or not. This function might be called in interrupt context.	
Available via	Dcm.h	

]()

8.4.6 Dcm_TxConfirmation

[SWS_Dcm_01092] [

Service Name	Dcm_TxConfirmation	
Syntax	<pre>void Dcm_TxConfirmation (PduIdType TxPduId, Std_ReturnType result)</pre>	
Service ID [hex]	0x40	
Sync/Async	Synchronous	
Reentrancy	Reentrant for different Pdulds. Non reentrant for the same Pduld.	
Parameters (in)	TxPduld	ID of the PDU that has been transmitted.
	result	E_OK: The PDU was transmitted. E_NOT_OK: Transmission of the PDU failed.
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	The lower layer communication interface module confirms the transmission of a PDU, or the failure to transmit a PDU. This function might be called in interrupt context.	
Available via	Dcm.h	

]()

8.4.7 Dcm_ComM_NoComModeEntered

[SWS_Dcm_00356] [

Service Name	Dcm_ComM_NoComModeEntered	
Syntax	<pre>void Dcm_ComM_NoComModeEntered (uint8 NetworkId)</pre>	
Service ID [hex]	0x21	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	NetworkId	Identifier of the network concerned by the mode change
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	This call informs the Dcm module about a ComM mode change to COMM_NO_COMMUNICATION.	
Available via	Dcm_ComM.h	

] ()

8.4.8 Dcm_ComM_SilentComModeEntered

[SWS_Dcm_00358] [

Service Name	Dcm_ComM_SilentComModeEntered	
Syntax	<pre>void Dcm_ComM_SilentComModeEntered (uint8 NetworkId)</pre>	
Service ID [hex]	0x22	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	NetworkId	Identifier of the network concerned by the mode change
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	This call informs the Dcm module about a ComM mode change to COMM_SILENT_COMMUNICATION.	
Available via	Dcm_ComM.h	

] ()

8.4.9 Dcm_ComM_FullComModeEntered

[SWS_Dcm_00360] [

Service Name	Dcm_ComM_FullComModeEntered	
Syntax	<pre>void Dcm_ComM_FullComModeEntered (uint8 NetworkId)</pre>	
Service ID [hex]	0x23	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	NetworkId	Identifier of the network concerned by the mode change
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	This call informs the Dcm module about a ComM mode change to COMM_FULL_COMMUNICATION.	
Available via	Dcm_ComM.h	

])()

8.4.10 Dcm_CsmAsyncJobFinished

[SWS_Dcm_91076] [

Service Name	Dcm_CsmAsyncJobFinished	
Syntax	<pre>Std_ReturnType Dcm_CsmAsyncJobFinished (Csm_ResultType result)</pre>	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	result	Return value of the asynchronous job
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: this value is always returned.
Description	Can be called from Csm upon finishing an asynchronous job processing. The integrator will configure this name as callback function within the Csm ECUC configuration for asynchronous jobs. Only one such callback is available, the Dcm detects the job that has finished by evaluating the job parameter. API availability: This API will be available only if ({ecuc(Dcm/Dcm Dsp/DcmDspAuthentication/DcmDspAuthenticationConnection} != null).	
Available via		

])()

8.4.11 Dcm_KeyMAsyncCertificateVerifyFinished

[SWS_Dcm_91077] [

Service Name	Dcm_KeyMAsyncCertificateVerifyFinished	
Syntax	<pre>Std_ReturnType Dcm_KeyMAsyncCertificateVerifyFinished (KeyM_CertificateIdType CertID, KeyM_CertificateStatusType Result)</pre>	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	CertID	Certificate identifier that has finished the verification
	Result	Return value of the asynchronous job
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: this value is always returned
Description	<p>Can be called from Key upon finishing an asynchronous certificate verification. The integrator will configure this name as callback function within the KeyM ECUC configuration for asynchronous jobs. Only one such callback is available, the Dcm detects the certificate that has finished by evaluating the certId parameter. API availability: This API will be available only if {{ecuc(Dcm/DcmDsp/DcmDspAuthentication/DcmDspAuthenticationConnection) != null}}.</p>	
Available via		

]()

8.5 Callout Definitions

Callouts are pieces of code that have to be added to the [Dcm](#) during ECU integration. The content of most callouts is hand-written code, for some callouts the [Dcm](#) configuration tool shall generate a default implementation that is manually edited by the integrator. Conceptually, these callouts belong to the ECU Firmware.

Since callouts are no services of the [Dcm](#) they do not have an assigned Service ID. Note: The Autosar architecture doesn't provide the possibility to access the ECU memory using a physical address. This is realized using BlockId which identifies a memory block.

According to that, the [Dcm](#) is not able to fully support the implementation of ISO14229-1 [1] services which request a physical memory access. Therefore, the [Dcm](#) defines callouts to realize this kind of memory access. This callout implementation could be simply realized by defining a mapping between the BlockId and the physical memory address.

8.5.1 Dcm_ReadMemory

[SWS_Dcm_00539] ↗

Service Name	Dcm_ReadMemory	
Syntax	<pre>Dcm_ReturnReadMemoryType Dcm_ReadMemory (Dcm_OpStatusType OpStatus, uint8 MemoryIdentifier, uint32 MemoryAddress, uint32 MemorySize, uint8* MemoryData, Dcm_NegativeResponseCodeType* ErrorCode)</pre>	
Service ID [hex]	0x26	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	OpStatus	DCM_INITIAL DCM_PENDING DCM_CANCEL DCM_FORCE_RCRP_OK
	MemoryIdentifier	Identifier of the Memory Block (e.g. used if memory section distinguishing is needed) Note: If it's not used this parameter shall be set to 0.
	MemoryAddress	Starting address of server memory from which data is to be retrieved.
	MemorySize	Number of bytes in the MemoryData
Parameters (inout)	None	
Parameters (out)	MemoryData	Data read (Points to the diagnostic buffer in DCM)
	ErrorCode	If the operation Dcm_ReadMemory returns value DCM_READ_FAILED, the Dcm module shall send a negative response with NRC code equal to the parameter ErrorCode parameter value.
Return value	Dcm_ReturnReadMemoryType	DCM_READ_OK: read was successful DCM_READ_FAILED: read was not successful DCM_READ_PENDING: read is not yet finished DCM_READ_FORCE_RCRP: reading is pending, the Response pending transmission starts immediately
Description	<p>The Dcm_ReadMemory callout is used to request memory data identified by the parameter memoryAddress and memorySize from the UDS request message. This service is needed for the implementation of UDS services:</p> <ul style="list-style-type: none"> • ReadMemoryByAddress • RequestUpload • ReadDataByIdentifier (in case of Dynamical DID defined by memory address) • TransferData 	
Available via	Dcm_Externals.h	

]()

8.5.2 Dcm_WriteMemory

[SWS_Dcm_00540] [

Service Name	Dcm_WriteMemory	
Syntax	<pre>Dcm_ReturnWriteMemoryType Dcm_WriteMemory (Dcm_OpStatusType OpStatus, uint8 MemoryIdentifier, uint32 MemoryAddress, uint32 MemorySize, const uint8* MemoryData, Dcm_NegativeResponseCodeType* ErrorCode)</pre>	
Service ID [hex]	0x27	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	OpStatus	DCM_INITIAL DCM_PENDING DCM_CANCEL DCM_FORCE_RCRP_OK
	MemoryIdentifier	Identifier of the Memory Block (e.g. used by WriteDataByIdentifier service). Note: If it's not used this parameter shall be set to 0.
	MemoryAddress	Starting address of server memory in which data is to be copied. Note: If it's not used (e.g. if the data is compressed) this parameter shall be set to 0.
	MemorySize	Number of bytes in MemoryData
	MemoryData	Data to write (Points to the diagnostic buffer in DCM)
Parameters (inout)	None	
Parameters (out)	ErrorCode	If the operation Dcm_WriteMemory returns value DCM_WRITE FAILED, the Dcm module shall send a negative response with NRC code equal to the parameter ErrorCode parameter value.
Return value	Dcm_ReturnWriteMemoryType	DCM_WRITE_OK: write was successful DCM_WRITE_FAILED: write was not successful DCM_WRITE_PENDING: write is not yet finished DCM_WRITE_FORCE_RCRP: writing is pending, the Response pending transmission starts immediately
Description	The Dcm_WriteMemory callout is used to write memory data identified by the parameter memoryAddress and memorySize. This service is needed for the implementation of UDS services : <ul style="list-style-type: none"> • WriteMemoryByAddress • RequestDownload • TransferData 	
Available via	Dcm_Externals.h	

]()

Note : The callout implementation shall take care of the following points :

- When writing data in NVRAM, take care to keep the consistency with data in the mirror RAM
- When writing data in memory, take care that a [SW-C](#) won't overwrite the data. Maybe the [SW-C](#) should be informed of this writing

8.5.3 Dcm_SetProgConditions

[[SWS_Dcm_00543](#)] [

Service Name	Dcm_SetProgConditions	
Syntax	<pre>Std_ReturnType Dcm_SetProgConditions (Dcm_OpStatusType OpStatus, const Dcm_ProgConditionsType* ProgConditions)</pre>	
Service ID [hex]	0x61	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	OpStatus	OpStatus DCM_INITIAL DCM_PENDING DCM_CANCEL DCM_FORCE_RCRRP_OK
	ProgConditions	Conditions on which the jump to bootloader has been requested
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: Conditions have correctly been set E_NOT_OK: Conditions cannot be set DCM_E_PENDING: Conditions set is in progress, a further call to this API is needed to end the setting DCM_E_FORCE_RCRRP: Application requests the transmission of a response Response Pending (NRC 0x78)
Description	The Dcm_SetProgConditions callout allows the integrator to store relevant information prior to jumping to bootloader / jump due to ECURest request. The context parameter are defined in Dcm_ProgConditionsType.	
Available via	Dcm_Externals.h	

])()

Note: In case the SecurityAccess AttemptCounter needs to be shared between application and bootloader in addition to the ProgConditionStructure the current value can be retrieved via the [API Xxx_GetSecurityAttemptCounter](#) (see chapter [7.6.4 Interaction](#))

8.5.4 Dcm_GetProgConditions

[SWS_Dcm_00544] [

Service Name	Dcm_GetProgConditions	
Syntax	<pre>Dcm_EcuStartModeType Dcm_GetProgConditions (Dcm_ProgConditionsType * ProgConditions)</pre>	
Service ID [hex]	0x62	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	ProgConditions	Conditions on which the jump from the bootloader has been requested

Return value	Dcm_EcuStartModeType	–
Description	The Dcm_GetProgConditions callout is called upon Dcm initialization and allows to determine if a response (\$50 or \$51) has to be sent. The context parameters are defined in Dcm_ProgConditionsType.	
Available via	Dcm_externals.h	

)]()

8.5.5 Dcm_ProcessRequestAddFile

[SWS_Dcm_91078] [

Service Name	Dcm_ProcessRequestAddFile	
Syntax	<pre>Std_ReturnType Dcm_ProcessRequestAddFile (Dcm_OpStatusType OpStatus, uint16 filePathAndNameLength, const uint8* filePathAndName, uint8 dataFormatIdentifier, uint64 fileSizeUncompressed, uint64 fileSizeCompressed, uint64* maxNumberOfBlockLength, Dcm_NegativeResponseCodeType* ErrorCode)</pre>	
Service ID [hex]	0x72	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	OpStatus filePathAndNameLength filePathAndName dataFormatIdentifier fileSizeUncompressed fileSizeCompressed	DCM_INITIAL: All In-parameters are valid. DCM_PENDING: All In-parameters are set to 0x00. DCM_CANCEL: All In-parameters are set to 0x00. DCM_FORCE_RCRP_OK: All In-parameters are set to 0x00.
		Defines the length in bytes for the parameter filePathAndName.
		Defines the file system location of the server where the file which shall be added, deleted, replaced or read from depending on the parameter modeOfOperation parameter. In addition this parameter includes the file name of the file which shall be added, deleted, replaced or read as part of the file path.
		This data-parameter is a one byte value with each nibble encoded separately. The high nibble specifies the "compression Method", and the low nibble specifies the "encryptingMethod". The value 0x00 specifies that neither compressionMethod nor encryptingMethod is used. Values other than 0x00 are vehicle manufacturer specific.
		Defines the size of the uncompressed file to be download in bytes.
		Defines the size of the compressed file to be downloaded in bytes.
Parameters (inout)	None	
Parameters (out)	maxNumberOfBlockLength	Max number of bytes to be included in each TransferData request excluding the SID and the blockSequenceCounter.

	ErrorCode	If the operation Dcm_ProcessRequestAddFile returns value E_NOT_OK, the DCM module shall send a negative response with NRC code equal to the parameter ErrorCode parameter value.
Return value	Std_ReturnType	E_OK: Request was successful E_NOT_OK: Request was not successful DCM_E_PENDING: Request is not yet finished DCM_E_FORCE_RCRRP: Application request the transmission of a response Response Pending (NRC 0x78)
Description		Callout function. DCM shall call this function to start a RequestFileTransfer process with mode OfOperation equal to 0x01 (AddFile).
Available via		Dcm_Externals.h

8.5.6 Dcm_ProcessRequestDeleteFile

[SWS_Dcm_91079] ↴

Service Name	Dcm_ProcessRequestDeleteFile	
Syntax	<pre>Std_ReturnType Dcm_ProcessRequestDeleteFile (Dcm_OpStatusType OpStatus, uint16 filePathAndNameLength, const uint8* filePathAndName, Dcm_NegativeResponseCodeType* ErrorCode)</pre>	
Service ID [hex]	0x73	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	OpStatus	DCM_INITIAL: All In-parameters are valid. DCM_PENDING: All In-parameters are set to 0x00. DCM_CANCEL: All In-parameters are set to 0x00. DCM_FORCE_RCRRP_OK: All In-parameters are set to 0x00.
	filePathAndNameLength	Defines the length in bytes for the parameter filePathAndName.
	filePathAndName	Defines the file system location of the server where the file which shall be added, deleted, replaced or read from depending on the parameter modeOfOperation parameter. In addition this parameter includes the file name of the file which shall be added, deleted, replaced or read as part of the file path.
Parameters (inout)	None	
Parameters (out)	ErrorCode	If the operation Dcm_ProcessRequestDeleteFile returns value E_NOT_OK, the DCM module shall send a negative response with NRC code equal to the parameter ErrorCode parameter value.
Return value	Std_ReturnType	E_OK: Request was successful E_NOT_OK: Request was not successful DCM_E_PENDING: Request is not yet finished DCM_E_FORCE_RCRRP: Application request the transmission of a response Response Pending (NRC 0x78)
Description	Callout function. DCM shall call this function to start a RequestFileTransfer process with mode OfOperation equal to 0x02 (DeleteFile).	

Available via

8.5.7 Dcm_ProcessRequestReplaceFile

[SWS_Dcm_91080] ↴

Service Name	Dcm_ProcessRequestReplaceFile	
Syntax	<pre>Std_ReturnType Dcm_ProcessRequestReplaceFile (Dcm_OpStatusType OpStatus, uint16 filePathAndNameLength, const uint8* filePathAndName, uint8 dataFormatIdentifier, uint64 fileSizeUncompressed, uint64 fileSizeCompressed, uint64* maxNumberOfBlockLength, Dcm_NegativeResponseCodeType* ErrorCode)</pre>	
Service ID [hex]	0x74	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	OpStatus	DCM_INITIAL: All In-parameters are valid. DCM_PENDING: All In-parameters are set to 0x00. DCM_CANCEL: All In-parameters are set to 0x00. DCM_FORCE_RCRP_OK: All In-parameters are set to 0x00.
	filePathAndNameLength	Defines the length in bytes for the parameter filePathAndName.
	filePathAndName	Defines the file system location of the server where the file which shall be added, deleted, replaced or read from depending on the parameter modeOfOperation parameter. In addition this parameter includes the file name of the file which shall be added, deleted, replaced or read as part of the file path.
	dataFormatIdentifier	This data-parameter is a one byte value with each nibble encoded separately. The high nibble specifies the "compression Method", and the low nibble specifies the "encryptingMethod". The value 0x00 specifies that neither compressionMethod nor encryptingMethod is used. Values other than 0x00 are vehicle manufacturer specific.
	fileSizeUncompressed	Defines the size of the uncompressed file to be download in bytes.
	fileSizeCompressed	Defines the size of the compressed file to be downloaded in bytes.
Parameters (inout)	None	
Parameters (out)	maxNumberOfBlockLength	Max number of bytes to be included in each TransferData request excluding the SID and the blockSequenceCounter.
	ErrorCode	If the operation Dcm_ProcessRequestReplaceFile returns value E_NOT_OK, the DCM module shall send a negative response with NRC code equal to the parameter ErrorCode parameter value.

Return value	Std_ReturnType	E_OK: Request was successful E_NOT_OK: Request was not successful DCM_E_PENDING: Request is not yet finished DCM_E_FORCE_RCRRP: Application request the transmission of a response Response Pending (NRC 0x78)
Description	Callout function. DCM shall call this function to start a RequestFileTransfer process with mode OfOperation equal to 0x03 (ReplaceFile).	
Available via	Dcm_Externals.h	

])

8.5.8 Dcm_ProcessRequestReadFile

[SWS_Dcm_91081] [

Service Name	Dcm_ProcessRequestReadFile	
Syntax	<pre>Std_ReturnType Dcm_ProcessRequestReadFile (Dcm_OpStatusType OpStatus, uint16 filePathAndNameLength, const uint8* filePathAndName, uint8 dataFormatIdentifier, uint64 fileSizeUncompressed, uint64 fileSizeCompressed, uint64* maxNumberOfBlockLength, Dcm_NegativeResponseCodeType* ErrorCode)</pre>	
Service ID [hex]	0x75	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	OpStatus filePathAndNameLength filePathAndName dataFormatIdentifier	DCM_INITIAL: All In-parameters are valid. DCM_PENDING: All In-parameters are set to 0x00. DCM_CANCEL: All In-parameters are set to 0x00. DCM_FORCE_RCRRP_OK: All In-parameters are set to 0x00.
		Defines the length in bytes for the parameter filePathAndName.
		Defines the file system location of the server where the file which shall be added, deleted, replaced or read from depending on the parameter modeOfOperation parameter. In addition this parameter includes the file name of the file which shall be added, deleted, replaced or read as part of the file path.
		This data-parameter is a one byte value with each nibble encoded separately. The high nibble specifies the "compression Method", and the low nibble specifies the "encryptingMethod". The value 0x00 specifies that neither compressionMethod nor encryptingMethod is used. Values other than 0x00 are vehicle manufacturer specific.
Parameters (inout)	None	
	fileSizeUncompressed	Defines the size of the uncompressed file to be uploaded in bytes.
	fileSizeCompressed	Defines the size of the compressed file to be uploaded in bytes.
	maxNumberOfBlockLength	Max number of bytes to be included in each TransferData response excluding the SID and the blockSequenceCounter.

	ErrorCode	If the operation Dcm_ProcessRequestReadFile returns value E_NOT_OK, the DCM module shall send a negative response with NRC code equal to the parameter ErrorCode parameter value.
Return value	Std_ReturnType	E_OK: Request was successful E_NOT_OK: Request was not successful DCM_E_PENDING: Request is not yet finished DCM_E_FORCE_RCRRP: Application request the transmission of a response Response Pending (NRC 0x78)
Description		Callout function. DCM shall call this function to start a RequestFileTransfer process with modeOfOperation equal to 0x04 (ReadFile).
Available via		Dcm_Externals.h

↴

8.5.9 Dcm_ProcessRequestReadDir

[SWS_Dcm_91082] ↴

Service Name	Dcm_ProcessRequestReadDir	
Syntax	<pre>Std_ReturnType Dcm_ProcessRequestReadDir (Dcm_OpStatusType OpStatus, uint16 filePathAndNameLength, const uint8* filePathAndName, uint64* dirInfoLength, uint64* maxNumberOfBlockLength, Dcm_NegativeResponseCodeType* ErrorCode)</pre>	
Service ID [hex]	0x76	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	OpStatus filePathAndNameLength filePathAndName	DCM_INITIAL: All In-parameters are valid. DCM_PENDING: All In-parameters are set to 0x00. DCM_CANCEL: All In-parameters are set to 0x00. DCM_FORCE_RCRRP_OK: All In-parameters are set to 0x00.
		Defines the length in bytes for the parameter filePathAndName.
		Defines the file system location of the server where the file which shall be added, deleted, replaced or read from depending on the parameter modeOfOperation parameter. In addition this parameter includes the file name of the file which shall be added, deleted, replaced or read as part of the file path.
Parameters (inout)	None	
Parameters (out)	dirInfoLength maxNumberOfBlockLength ErrorCode	Defines the size of directory information to be uploaded in bytes. Max number of bytes to be included in each TransferData request excluding the SID and the blockSequenceCounter. If the operation Dcm_ProcessRequestReadDir returns value E_NOT_OK, the DCM module shall send a negative response with NRC code equal to the parameter ErrorCode parameter value.

△

Return value	Std_ReturnType	E_OK: Request was successful E_NOT_OK: Request was not successful DCM_E_PENDING: Request is not yet finished DCM_E_FORCE_RCRRP: Application request the transmission of a response Response Pending (NRC 0x78)
Description	Callout function. DCM shall call this function to start a RequestFileTransfer process with mode OfOperation equal to 0x05 (ReadDir).	
Available via	Dcm_Externals.h	

↴()

8.5.10 Dcm_WriteFile

[SWS_Dcm_91083] ↴

Service Name	Dcm_WriteFile	
Syntax	<pre>Std_ReturnType Dcm_WriteFile (Dcm_OpStatusType OpStatus, uint64 DataLength, uint8* Data, Dcm_NegativeResponseCodeType* ErrorCode)</pre>	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	OpStatus	DCM_INITIAL: All In-parameters are valid. DCM_PENDING: All In-parameters are set to 0x00. DCM_CANCEL: All In-parameters are set to 0x00. DCM_FORCE_RCRRP_OK: All In-parameters are set to 0x00.
	DataLength	Defines the length in bytes for the parameter Data. The value will not exceed, but might be less, compared to the value of max NumberOfBlockLength return in Dcm_ProcessRequestFile Transfer.
	Data	Pointer to the data to be written.
Parameters (inout)	None	
Parameters (out)	ErrorCode	If the operation Dcm_WriteFile returns value E_NOT_OK, the DCM module shall send a negative response with NRC code equal to the parameter ErrorCode parameter value.
Return value	Std_ReturnType	E_OK: Request was successful E_NOT_OK: Request was not successful DCM_E_PENDING: Request is not yet finished DCM_E_FORCE_RCRRP: Application request the transmission of a response Response Pending (NRC 0x78)
Description	Callout function. DCM shall call this function when data is received using UDS service Transfer Data if there's an ongoing RequestFileTransfer process started with 0x01 (AddFile) or 0x03 (ReplaceFile).	
Available via	Dcm_Externals.h	

↴()

8.5.11 Dcm_ReadFileOrDir

[SWS_Dcm_91085] ↗

Service Name	Dcm_ReadFileOrDir	
Syntax	<pre>Std_ReturnType Dcm_ReadFileOrDir (Dcm_OpStatusType OpStatus, uint64* DataLength, uint8* Data, Dcm_NegativeResponseCodeType* ErrorCode)</pre>	
Service ID [hex]	0x78	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	OpStatus	DCM_INITIAL: All In-parameters are valid. DCM_PENDING: All In-parameters are set to 0x00. DCM_CANCEL: All In-parameters are set to 0x00. DCM_FORCE_RCRP_OK: All In-parameters are set to 0x00.
	Data	Pointer to the data to be written.
Parameters (inout)	DataLength	As in, the parameter defines the maximum block length to be used, i.e. the value of maxNumberOfBlockLength sent to the client in the response of RequestFileTransfer. As out, the parameter defines the actual length in bytes for the parameter Data. The value shall not exceed, but might be less, the value provided as in parameter.
	ErrorCode	If the operation Dcm_ReadFileOrDir returns value E_NOT_OK, the DCM module shall send a negative response with NRC code equal to the parameter ErrorCode parameter value.
Return value	Std_ReturnType	E_OK: Request was successful E_NOT_OK: Request was not successful DCM_E_PENDING: Request is not yet finished DCM_E_FORCE_RCRP: Application request the transmission of a response Response Pending (NRC 0x78)
Description	Callout function. DCM shall call this function when data shall be sent as a response to UDS service TransferData if there's an ongoing RequestFileTransfer process started with 0x04 (ReadFile) or 0x05 (ReadDir).	
Available via	Dcm_Externals.h	

↗()

8.6 Scheduled functions

These functions are directly called by Basic Software Scheduler. The following functions shall have no return value and no parameter. All functions shall be non reentrant.

8.6.1 Dcm_MainFunction

[SWS_Dcm_00053] ↗

Service Name	Dcm_MainFunction
Syntax	<pre>void Dcm_MainFunction (void)</pre>
Service ID [hex]	0x25
Description	This service is used for processing the tasks of the main loop.
Available via	SchM_Dcm.h

」(SRS_BSW_00424, SRS_BSW_00373)

8.7 Expected interfaces

In this chapter all interfaces required from other modules are listed.

8.7.1 Mandatory interfaces

This section defines all interfaces, which are required to fulfill the core functionality of the module.

[SWS_Dcm_91001] 〔

API Function	Header File	Description
ComM_DCM_ActiveDiagnostic	ComM_Dcm.h	Indication of active diagnostic by the DCM.
ComM_DCM_InactiveDiagnostic	ComM_Dcm.h	Indication of inactive diagnostic by the DCM.
PduR_DcmTransmit	PduR_Dcm.h	Requests transmission of a PDU.

」()

8.7.2 Optional interfaces

This section defines all interfaces, which are required to fulfill an optional functionality of the module.

[SWS_Dcm_91002] 〔

API Function	Header File	Description
BndM_GetBlockPtr_<Block Id.Shortname>	BndM_Externals.h	—

API Function	Header File	Description
BndM_WriteBlock_<Block Id.Shortname>	BndM_Externals.h	Will persist the data in flash, that it can later directly accessed via BndM_GetBlockPtr API. The writing take a while and is finished after the successful callback <code>xxx_BndMWriteBlockFinish</code>
BndM_WriteCancel	BndM.h	Cancels the writing
BndM_WriteFinalize	BndM.h	Will trigger the finalization of writing phase. The finish of asynchronous processing will trigger the callback <code>xxx_BndMWriteFinalizeFinish</code> including the result of this operation.
BndM_WriteStart	BndM.h	Will trigger the start of writing phase. The finish of asynchronous processing will trigger the callback <code>xxx_BndMWriteStartFinish</code> including the result of this operation
BswM_Dcm_ApplicationUpdated	BswM_Dcm.h	This function is called by the DCM in order to report an updated application.
BswM_Dcm_CommunicationMode_CurrentState	BswM_Dcm.h	Function called by DCM to inform the BswM about the current state of the communication mode.
Dem_ClearDTC	Dem.h	Clears single DTCs, as well as groups of DTCs.
Dem_DcmGetAvailableOBDMIDs	Dem_Dcm.h	Reports the value of a requested "availability-OBDMID" to the DCM upon a Service \$06 request. Derived from that the tester displays the supported tests a mechanic can select from. API is needed in OBD-relevant ECUs only. API Availability: This API will be available only if <code>({ecuc(Dem/DemGeneral.DemOBDSupport)} != DEM_OBD_NO_OBD_SUPPORT)</code>
Dem_DcmGetDTCOfOBDFreezeFrame	Dem_Dcm.h	Gets DTC by freeze frame record number. API is needed in OBD-relevant ECUs only. API Availability: This API will be available only if <code>({ecuc(Dem/DemGeneral.DemOBDSupport)} != DEM_OBD_NO_OBD_SUPPORT)</code>
Dem_DcmGetDTRData	Dem_Dcm.h	Reports a DTR data along with TID-value, UaSID, test result with lower and upper limit. API is needed in OBD-relevant ECUs only. API Availability: This API will be available only if <code>({ecuc(Dem/DemGeneral.DemOBDSupport)} != DEM_OBD_NO_OBD_SUPPORT)</code>
Dem_DcmGetNumTIDsOfOBDMID	Dem_Dcm.h	Gets the number of TIDs per (functional) OBDMID. This can be used by the DCM to iteratively request for OBD/TID result data within a loop from 0....numberOfTIDs-1 API is needed in OBD-relevant ECUs only. API Availability: This API will be available only if <code>({ecuc(Dem/DemGeneral.DemOBDSupport)} != DEM_OBD_NO_OBD_SUPPORT)</code>
Dem_DcmReadDataOfOBDFreezeFrame	Dem_Dcm.h	Gets data element per PID and index of the most important freeze frame being selected for the output of service \$02. The function stores the data in the provided DestBuffer. API is needed in OBD-relevant ECUs only. API Availability: This API will be available only if <code>({ecuc(Dem/DemGeneral.DemOBDSupport)} != DEM_OBD_NO_OBD_SUPPORT)</code>
Dem_DisableDTCRecordUpdate	Dem.h	Disables the event memory update of a specific DTC (only one at one time).

API Function	Header File	Description
Dem_DisableDTCSetting	Dem.h	Disables the DTC setting for all DTCs assigned to the DemEventMemorySet of the addressed client.
Dem_EnableDTCRecordUpdate	Dem.h	Enables the event memory update of the DTC disabled by Dem_DisableDTCRecordUpdate() before. Note: As the call to Dem_EnableDTCRecordUpdate is the last action in the sequence of disabling/enabling a DTC, the caller is not interested in the return value. Therefore E_OK should be returned even if the DTC is enabled asynchronously.
Dem_EnableDTCSetting	Dem.h	(Re)-Enables the DTC setting for all DTCs assigned to the DemEventMemorySet of the addressed client.
Dem_GetDTCByOccurrenceTime	Dem.h	Gets the DTC by occurrence time. There is no explicit parameter for the DTC-origin as the origin always is DEM_DTC_ORIGIN_PRIMARY_MEMORY.
Dem_GetDTCSeverityAvailabilityMask	Dem.h	Gets the DTC Severity availability mask.
Dem_GetDTCStatusAvailabilityMask	Dem.h	Gets the DTC Status availability mask of the selected fault memory.
Dem_GetFunctionalUnitOfDTC	Dem.h	Gets the functional unit of the requested DTC.
Dem_GetNextExtendedDataRecord	Dem.h	Gets extended data record for the DTC selected by Dem_SelectExtendedDataRecord. The function stores the data in the provided DestBuffer.
Dem_GetNextFilteredDTC	Dem.h	Gets the next filtered DTC matching the filter criteria. For UDS services, the interface has an asynchronous behavior, because a large number of DTCs has to be processed.
Dem_GetNextFilteredDTCAndFDC	Dem.h	Gets the next filtered DTC and its associated Fault Detection Counter (FDC) matching the filter criteria. The interface has an asynchronous behavior, because a large number of DTCs has to be processed and the FDC might be received asynchronously from a SW-C, too.
Dem_GetNextFilteredDTCAndSeverity	Dem.h	Gets the next filtered DTC and its associated Severity matching the filter criteria. The interface has an asynchronous behavior, because a large number of DTCs has to be processed.
Dem_GetNextFilteredRecord	Dem.h	Gets the next freeze frame record number and its associated DTC stored in the event memory. The interface has an asynchronous behavior, because NvRAM access might be required.
Dem_GetNextFreezeFrameData	Dem.h	Gets freeze frame data by the DTC selected by Dem_SelectFreezeFrameData. The function stores the data in the provided DestBuffer.
Dem_GetNumberOfFilteredDTC	Dem.h	Gets the number of a filtered DTC.
Dem_GetNumberOfFreezeFrameRecords	Dem.h	This function returns the number of all freeze frame records currently stored in the primary event memory
Dem_GetSeverityOfDTC	Dem.h	Gets the severity of the requested DTC. For large configurations and DTC-calibration, the interface behavior can be asynchronous (splitting the DTC-search into segments).
Dem.GetSizeOfExtendedDataRecordSelection	Dem.h	Gets the size of Extended Data Record by DTC selected by the call of Dem_SelectExtendedDataRecord.

API Function	Header File	Description
Dem_GetSizeOfFreezeFrameSelection	Dem.h	Gets the size of freeze frame data by DTC selected by the call of Dem_SelectFreezeFrameData.
Dem_GetStatusOfDTC	Dem.h	Gets the status of a DTC. For large configurations and DTC-calibration, the interface behavior can be asynchronous (splitting the DTC-search into segments). The DTCs of OBD Events Suppression shall be reported as Dem_WRONG_DTC.
Dem_GetTranslationType	Dem.h	Gets the supported DTC formats of the ECU. The supported formats are configured via DemTypeOfDTCSupported.
Dem_SetDTCFilter	Dem.h	<p>Sets the DTC Filter.</p> <p>The server shall perform a bit-wise logical AND-ing operation between the parameter DTCStatusMask and the current UDS status in the server. In addition to the DTCStatusAvailabilityMask, the server shall return all DTCs for which the result of the AND-ing operation is non-zero [i.e. $(statusOfDTC \& DTCStatusMask) != 0$]. The server shall process only the DTC Status bits that it is supporting. OBD Events Suppression shall be ignored for this computation. If no DTCs within the server match the masking criteria specified in the clients request, no DTC or status information shall be provided following the DTCStatusAvailabilityMask byte in the positive response message</p> $(((statusOfDTC \& DTCStatusMask) != 0) \& \& ((severity \& DTCSeverityMask) != 0)) == \text{TRUE}$
Dem_SetFreezeFrameRecordFilter	Dem.h	Sets a freeze frame record filter.
Det_ReportError	Det.h	Service to report development errors.
IdsM_SetSecurityEvent	IdsM.h	This API is the application interface to report security events to the IdsM.
IdsM_SetSecurityEventWithContextData	IdsM.h	This API is the application interface to report security events with context data to the IdsM.
IoHwAb_Dcm_<EcuSignalName>	IoHwAb_Dcm.h	This function provides control access to a certain ECU Signal to the DCM module (<EcuSignalname> is the symbolic name of an ECU Signal). The ECU signal can be locked and unlocked by this function. Locking 'freezes' the ECU signal to the current value, the configured default value or a value given by the parameter 'signal'.
IoHwAb_Dcm_Read<EcuSignalName>	IoHwAb_Dcm.h	This function provides read access to a certain ECU Signal to the DCM module (<EcuSignalname> is the symbolic name of an ECU Signal).
NvM_ReadBlock	NvM.h	Service to copy the data of the NV block to its corresponding RAM block.
NvM_SetBlockLockStatus	NvM.h	Service for setting the lock status of a permanent RAM block or of the explicit synchronization of a NVRAM block.
NvM_SetRamBlockStatus	NvM.h	Service for setting the RAM block status of a permanent RAM block or the status of the explicit synchronization of a NVRAM block.
NvM_WriteBlock	NvM.h	Service to copy the data of the RAM block to its corresponding NV block.
PduR_DcmCancelReceive	PduR_Dcm.h	Requests cancellation of an ongoing reception of a PDU in a lower layer transport protocol module.

API Function	Header File	Description
PduR_DcmCancelTransmit	PduR_Dcm.h	Requests cancellation of an ongoing transmission of a PDU in a lower layer communication module.
SchM_ActMainFunction_Dcm	<none>	Invokes the SchM_ActMainFunction function to trigger the activation of a corresponding main processing function.

])

Dem_DcmReadDataOfOBDFreezeFrame is only required when [OBD](#) Service \$02 is configured (see configuration parameter [DcmDsdSidTabServiceId](#)).

8.7.3 Configurable interfaces

This section defines the interfaces where the [Dcm](#) configuration defines the actual functions that the [Dcm](#) will use. Depending on the configuration, an implementation of these functions could be provided by other BSW-modules (typically the DEM) or by software-components (through the RTE).

8.7.3.1 SecurityAccess

From the point of view of the DCM, the operation has the following signature:

8.7.3.1.1 GetSeed

If [DcmDspSecurityADRSIZE](#) is present:

[SWS_Dcm_01151] [

Service Name	Xxx_GetSeed	
Syntax	<pre>Std_ReturnType Xxx_GetSeed (const uint8* SecurityAccessDataRecord, Dcm_OpStatusType OpStatus, uint8* Seed, Dcm_NegativeResponseCodeType* ErrorCode)</pre>	
Service ID [hex]	0x44	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	SecurityAccessData Record	This data record contains additional data to calculate the seed value; the size of this parameter is DcmDspSecurityADRSIZE which is at least "1".

△

	OpStatus	Status of the current operation
Parameters (inout)	None	
Parameters (out)	Seed	Pointer for provided seed
	ErrorCode	If the operation Xxx_GetSeed returns value E_NOT_OK, the DCM module shall send a negative response with NRC code equal to the parameter ErrorCode parameter value.
Return value	Std_ReturnType	E_OK: Request was successful. E_NOT_OK: Request was not successful. DCM_E_PENDING: Request is not yet finished. Further call(s) required to finish.
Description	Request to application for asynchronous provision of seed value	
Available via	Dcm_Externals.h	

↴()

If `DcmDspSecurityADRSIZE` is not present:

[SWS_Dcm_91003] ↴

Service Name	Xxx_GetSeed	
Syntax	<pre>Std_ReturnType Xxx_GetSeed (Dcm_OpStatusType OpStatus, uint8* Seed, Dcm_NegativeResponseCodeType* ErrorCode)</pre>	
Service ID [hex]	0x45	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	OpStatus	Status of the current operation
Parameters (inout)	None	
Parameters (out)	Seed	Pointer for provided seed
	ErrorCode	If the operation Xxx_GetSeed returns value E_NOT_OK, the DCM module shall send a negative response with NRC code equal to the parameter ErrorCode parameter value.
Return value	Std_ReturnType	E_OK: Request was successful. E_NOT_OK: Request was not successful. DCM_E_PENDING: Request is not yet finished. Further call(s) required to finish.
Description	Request to application for asynchronous provision of seed value	
Available via	Dcm_Externals.h	

↴()

8.7.3.1.2 CompareKey

[SWS_Dcm_91004] ↴

Service Name	Xxx_CompareKey	
Syntax	<pre>Std_ReturnType Xxx_CompareKey (const uint8* Key, Dcm_OpStatusType OpStatus, Dcm_NegativeResponseCodeType* ErrorCode)</pre>	
Service ID [hex]	0x47	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	Key	Key, which needs to be compared
	OpStatus	Status of the current operation
Parameters (inout)	None	
Parameters (out)	ErrorCode	NRC to be sent if E_NOT_OK is returned
Return value	Std_ReturnType	E_OK: Request was successful. E_NOT_OK: Request was not successful. DCM_E_PENDING: Request is not yet finished. Further call(s) required to finish. DCM_E_COMPARE_KEY_FAILED: Key did not match.
Description	Request to application for asynchronous comparing key (DcmDspSecurityUsePort = USE_ASYNCH_CLIENT_SERVER)	
Available via	Dcm_Externals.h	

]()

8.7.3.1.3 GetSecurityAttemptCounter

[SWS_Dcm_01152] [

Service Name	Xxx_GetSecurityAttemptCounter	
Syntax	<pre>Std_ReturnType Xxx_GetSecurityAttemptCounter (Dcm_OpStatusType OpStatus, uint8* AttemptCounter)</pre>	
Service ID [hex]	0x59	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	OpStatus	DCM_INITIAL DCM_PENDING DCM_CANCEL
Parameters (inout)	None	
Parameters (out)	AttemptCounter	The attempt counter for this security level
Return value	Std_ReturnType	E_OK: Request was successful. E_NOT_OK: Request was not successful. DCM_E_PENDING: Request is not yet finished. Further call(s) required to finish.
Description	Read the attempt counter for a specific security level from the application	
Available via	Dcm_Externals.h	

]()

Note: In case the Security Access AttemptCounter needs to be shared between application and bootloader, the application needs to consider this in the API-call [Xxx_SetSecurityAttemptCounter](#) (see chapter [7.6.4 Interaction](#)). Further this has also impact on the security delay timer which needs to be considered.

8.7.3.1.4 SetSecurityAttemptCounter

[SWS_Dcm_01153] ↗

Service Name	Xxx_SetSecurityAttemptCounter	
Syntax	<pre>Std_ReturnType Xxx_SetSecurityAttemptCounter (Dcm_OpStatusType OpStatus, uint8 AttemptCounter)</pre>	
Service ID [hex]	0x5a	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	OpStatus	DCM_INITIAL DCM_PENDING DCM_CANCEL
	AttemptCounter	The attempt counter for this security level
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: Request was successful. E_NOT_OK: Request was not successful. DCM_E_PENDING: Request is not yet finished. Further call(s) required to finish.
Description	Set the attempt counter for a specific security level in the application	
Available via	Dcm_Externals.h	

↘()

8.7.3.2 DataServices

From the point of view of the DCM, the operations have the following signatures:

Note : The OpStatus parameter shall only exist for asynchronous operations (if [DcmDspDataUsePort](#) is set to [USE_DATA_ASYNCH_CLIENT_SERVER](#) or [USE_DATA_ASYNCH_CLIENT_SERVER_ERROR](#) or [USE_DATA_ASYNCH_FNC](#) or [USE_DATA_ASYNCH_FNC_ERROR](#)). In case of synchronous operations ([DcmDspDataUsePort](#) is set to [USE_DATA_SYNCH_CLIENT_SERVER](#) or [USE_DATA_SYNCH_FNC](#)), the OpStatus parameter shall not exist.

8.7.3.2.1 ReadData

If [DcmDspDataUsePort](#) is set to [USE_DATA_SYNCH_CLIENT_SERVER](#) or [USE_DATA_SYNCH_FNC](#), the following definition is used:

[SWS_Dcm_00793] ↴

Service Name	Xxx_ReadData	
Syntax	<pre>Std_ReturnType Xxx_ReadData (uint8* Data)</pre>	
Service ID [hex]	0x34	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	Data	Buffer where the requested data shall be copied to
Return value	Std_ReturnType	E_OK: this value is always returned.
Description	This function requests to the application a data value of a DID/PID if DcmDspDataUsePort is set to USE_DATA_SYNCH_CLIENT_SERVER.	
Available via	Dcm_Externals.h	

↳

If `DcmDspDataUsePort` is set to `USE_DATA_SYNCH_CLIENT_SERVER` or `USE_DATA_SYNCH_FNC`, the following definition is used:

[SWS_Dcm_91006] ↴

Service Name	Xxx_ReadData	
Syntax	<pre>Std_ReturnType Xxx_ReadData (Dcm_OpStatusType OpStatus, uint8* Data)</pre>	
Service ID [hex]	0x3b	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	OpStatus	Status of the current operation
Parameters (inout)	None	
Parameters (out)	Data	Buffer where the requested data shall be copied to
Return value	Std_ReturnType	E_OK: Request was successful. DCM_E_PENDING: Request is not yet finished. Further call(s) required to finish.
Description	This function requests to the application a data value of a DID/PID if DcmDspDataUsePort is set to USE_DATA_SYNCH_CLIENT_SERVER.	
Available via	Dcm_Externals.h	

↳

If `DcmDspDataUsePort` is set to `USE_DATA_SYNCH_CLIENT_SERVER_ERROR` or `USE_DATA_SYNCH_FNC_ERROR`, the following definition is used:

[SWS_Dcm_91005] ↴

Service Name	Xxx_ReadData	
Syntax	<pre>Std_ReturnType Xxx_ReadData (Dcm_OpStatusType OpStatus, uint8* Data, Dcm_NegativeResponseCodeType* ErrorCode)</pre>	
Service ID [hex]	0x58	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	OpStatus	Status of the current operation
Parameters (inout)	None	
Parameters (out)	Data	Buffer where the requested data shall be copied to
	ErrorCode	If the operation Xxx_ReadData returns value E_NOT_OK, the Dcm module shall send a negative response with NRC code equal to the parameter ErrorCode parameter value.
Return value	Std_ReturnType	E_OK: Request was successful. DCM_E_PENDING: Request is not yet finished. Further call(s) required to finish.
Description	This function requests to the application a data value of a DID/PID if DcmDspDataUsePort is set to USE_DATA_ASYNCH_CLIENT_SERVER.	
Available via	Dcm_Externals.h	

」()

8.7.3.2.2 WriteData

If `DcmDspDataUsePort` is set to `USE_DATA_SYNCH_CLIENT_SERVER` or `USE_DATA_SYNCH_FNC`, the following definition is used:

If `DcmDspDataType` is NOT set to `UINT8_DYN`, the following definition is used:

[SWS_Dcm_00794] 「

Service Name	Xxx_WriteData	
Syntax	<pre>Std_ReturnType Xxx_WriteData (const uint8* Data, Dcm_NegativeResponseCodeType* ErrorCode)</pre>	
Service ID [hex]	0x51	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	Data	Buffer containing the data to be written
Parameters (inout)	None	
Parameters (out)	ErrorCode	If the operation Xxx_WriteData returns value E_NOT_OK, the DCM module shall send a negative response with NRC code equal to the parameter ErrorCode parameter value.

Return value	Std_ReturnType	E_OK: Request was successful. E_NOT_OK: Request was not successful.
Description	This function requests the application to write a data value of a DID.	
Available via	Dcm_Externals.h	

]()

If `DcmDspDataType` is set to `UINT8_DYN`, the following definition is used:

[SWS_Dcm_91007] [

Service Name	Xxx_WriteData	
Syntax	<pre>Std_ReturnType Xxx_WriteData (const uint8* Data, uint16 DataLength, Dcm_NegativeResponseCodeType* ErrorCode)</pre>	
Service ID [hex]	0x52	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	Data	Buffer containing the data to be written
	DataLength	Length in byte of the data to be written
Parameters (inout)	None	
Parameters (out)	ErrorCode	If the operation <code>Xxx_WriteData</code> returns value <code>E_NOT_OK</code> , the DCM module shall send a negative response with NRC code equal to the parameter <code>ErrorCode</code> parameter value.
Return value	Std_ReturnType	E_OK: Request was successful. E_NOT_OK: Request was not successful.
Description	This function requests the application to write a data value of a DID.	
Available via	Dcm_Externals.h	

]()

If `DcmDspDataUsePort` is set to `USE_DATA_ASYNC_CLIENT_SERVER` or `USE_DATA_ASYNC_CLIENT_FNC` or `USE_DATA_ASYNC_CLIENT_SERVER_ERROR` or `USE_DATA_ASYNC_FNC_ERROR`, the following definition is used:

If `DcmDspDataType` is NOT set to `UINT8_DYN`, the following definition is used:

[SWS_Dcm_91008] [

Service Name	Xxx_WriteData	
Syntax	<pre>Std_ReturnType Xxx_WriteData (const uint8* Data, Dcm_OpStatusType OpStatus, Dcm_NegativeResponseCodeType* ErrorCode)</pre>	

Service ID [hex]	0x35	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	Data	Buffer containing the data to be written

8.7.3.3 **DataServices_DIDRange**

From the point of view of the DCM, the operations have the following signatures:

Note : The OpStatus parameter should only be used for asynchronous operations (if `DcmDspDataUsePort` is set to `USE_DATA_ASYNCH_CLIENT_SERVER` or `USE_DATA_ASYNCH_FNC` or `USE_DATA_ASYNCH_CLIENT_SERVER_ERROR` `USE_DATA_ASYNCH_FNC_ERROR`). In case of synchronous operations (`DcmDspDataUsePort` is set to `USE_DATA_SYNCH_CLIENT_SERVER` or `USE_DATA_SYNCH_FNC`), the OpStatus parameter should not be used.

8.7.3.3.1 **IsDidAvailable**

[SWS_Dcm_00803] ↗

Service Name	Xxx_IsDidAvailable	
Syntax	<pre>Std_ReturnType Xxx_IsDidAvailable (uint16 DID, Dcm_OpStatusType OpStatus, Dcm_DidSupportedType* supported)</pre>	
Service ID [hex]	0x53	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	DID	DID value
	OpStatus	Status of the current operation
Parameters (inout)	None	
Parameters (out)	supported	Indicate if the DID is available within the range. Returning DCM_DID_SUPPORTED means it is supported within the range, Returning DCM_DID_NOT_SUPPORTED means it is not supported within the range
Return value	Std_ReturnType	E_OK: This value is returned when the Did is finally available. DCM_E_PENDING: Request is not yet finished. Further call(s) required to finish.
Description	This function requests if a specific DID is available within the range or not.	
Available via	Dcm_Externals.h

8.7.3.5 RoutineServices

The operations mentioned in the following sub-chapters are only general examples, because the number of In and OUT parameters can be variable from 0 to an arbitrary number. It is therefore not possible to list all variations of operation prototypes.

8.7.3.5.1 Xxx_Start Operation

[SWS_Dcm_01203] [

Service Name	Xxx_Start
Syntax	<pre>Std_ReturnType Xxx_Start ([DcmDspRoutineSignalType dataIn_1, ... DcmDspRoutineSignalType dataIn_n], [const uint8* dataInVar],</pre> <div style="text-align: right;">▽</div>

△

	$ \begin{aligned} & \text{Dcm_OpStatusType OpStatus,} \\ & \text{[DcmDspRoutineSignalType dataOut_1, ...} \\ & \text{DcmDspRoutineSignalType dataOut_n],} \\ & \text{[uint8* dataOutVar],} \\ & \text{[uint16* currentDataLength],} \\ & \text{Dcm_NegativeResponseCodeType ErrorCode} \\ &) \end{aligned} $	
Service ID [hex]	0x5b	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	dataIn_1	Fixed-length input data provided in the routine control request

	dataIn_n	Fixed-length input data provided in the routine control request
	dataInVar	Variable-length input data provided in the routine control request
	OpStatus	Status of the current operation
Parameters (inout)	currentDataLength	If variable length routine input data is used, this parameter contains the length in bytes of the dataInVar array. If variable length routine output data is used, this parameter contains the length in bytes of the dataOutVar parameter.
Parameters (out)	dataOut_1	Fixed-length output data to provide in the routine control response

	dataOut_n	Fixed-length output data to provide in the routine control response
	dataOutVar	Variable-length output data to provide in the routine control response
	ErrorCode	If the operation Xxx_Start returns value E_NOT_OK, the Dcm module shall send a negative response with NRC code equal to the parameter ErrorCode parameter value.
Return value	Std_ReturnType	E_OK: Request was successful. E_NOT_OK: Request was not successful. DCM_E_PENDING: Request is not yet finished. Further call(s) required to finish. DCM_E_FORCE_RCRRP: application requests the transmission of a response Pending (NRC 0x78)
Description	This function requests to the application to start the execution of a routine.	
Available via	Dcm_Externals.h	

]()

Note: Square brackets [] indicate that an argument is optional.

Note: Square brackets [] indicate that an argument is optional.

8.7.3.6 RequestControlServices

From the point of view of the DCM, the operation has the following signature:

8.7.3.6.1 RequestControl callout

[SWS_Dcm_01338] [

Service Name	Xxx_RequestControl	
Syntax	<pre>Std_ReturnType Xxx_RequestControl (uint8* OutBuffer, const uint8* InBuffer)</pre>	
Service ID [hex]	0x63	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	None	
Parameters (inout)	OutBuffer	Output buffer in which the RequestControl function can store its result
	InBuffer	Input buffer containing the data of the OBD Service 0x08 request
Parameters (out)	None	
Return value	Std_ReturnType	<pre>E_OK: Request was successful. E_NOT_OK: Request was not successful.</pre>

△

Description	Invokes a TID-specific function taking a configured number of bytes as input and returning a fixed number of bytes as output. This is typically used to implement OBD Service \$08
Available via	Dcm_Externals.h

↴

8.7.3.7 CallbackDCMRequestServices

From the point of view of the DCM, the operations have the following signatures:

8.7.3.7.1 StartProtocol

[SWS_Dcm_01339] ↴

Service Name	Xxx_StartProtocol	
Syntax	<pre>Std_ReturnType Xxx_StartProtocol (Dcm_ProtocolType ProtocolType, uint16 TesterSourceAddress, uint16 ConnectionId)</pre>	
Service ID [hex]	0x67	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	ProtocolType	Type of the protocol to be started
	TesterSourceAddress	source address of the tester
	ConnectionId	Unique connection identifier
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: Request was successful. E_NOT_OK: Request was not successful. E_PROTOCOL_NOT_ALLOWED: Protocol not allowed
Description	This function allows the application to examine the environment conditions and enable/disable further processing of the protocol.	
Available via	Dcm_Externals.h	

↴

8.7.3.7.2 StopProtocol

[SWS_Dcm_01340] ↴

Service Name	Xxx_StopProtocol	
Syntax	<pre>Std_ReturnType Xxx_StopProtocol (Dcm_ProtocolType ProtocolType, uint16 TesterSourceAddress, uint16 ConnectionId)</pre>	
Service ID [hex]	0x64	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	ProtocolType	Type of the protocol to be stopped
	TesterSourceAddress	source address of the tester
	ConnectionId	Unique connection identifier
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: Request was successful. E_NOT_OK: Request was not successful.
Description	This function informs the application of the protocol stop.	
Available via	Dcm_Externals.h

Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	SID	-

	requestData	Complete request data (diagnostic buffer), except the service ID
	dataSize	Number of valid bytes in the requestData parameter
	reqType	Addressing type of the request(0=physical request,1=functional request)
	connectionId	Unique connection identifier
	protocolType	Type of the protocol to be indicated
	testerSourceAddress	source address of the tester
Parameters (inout)	None	
Parameters (out)	errorCode	If the operation Xxx_Indication re- turns value E_NOT_OK, the Dcm module shall send a negative response with NRC code equal to the parameter ErrorCode parameter value
Return value	Std_ReturnType	E_OK: Request was successful. E_NOT_OK: Request was not successful. E_REQUEST_NOT_ACCEPTED : Request not accepted
Description	This function indicates to the application that a service is about to be executed and allows the application to reject the execution of the service request	
Available via	Dcm_Externals.h

8.8.1.11 {DID}_Struct_DataType

This data type has a different modeling as other data types. The {DID}_Struct_DataType datatype is modeled as prosa text only. At the time this specification was created there are no means to visualize this datatype with existing AUTOSAR tooling as table as all the other data types. Still AUTOSAR allows modeling such data types. Simply that they cannot be shown here as table.

[SWS_Dcm_91056] ↴

Name	{DID}_Struct_DataType
Kind	Structure
Description	The elements of this structure data type is a composition of all DcmDspDataElement of the DcmDspDid. Example: A DID with the 3 data elements uint32 data1, sint8 data2 and sint16 data 3, has a structure definition of struct { uint32 data1, sint8 data2, sint16 data 3}.
Variation	{ecuc(Dcm/DcmConfigSet/DcmDsp/DcmDspDid/DcmDspDidUsePort)} == ((USE_ATOMIC_SENDER_RECEIVER_INTERFACE USE_ATOMIC_SENDER_RECEIVER_INTERFACE_AS_SERVICE) USE_ATOMIC_NV_DATA_INTERFACE) DID = {ecuc(Dcm/DcmConfigSet/DcmDsp/DcmDspDid.SHORT-NAME)}

Available via	Rte_Dcm_Type.h	

]()

The [Dcm_Cemr_Type](#) data type defines a bitfield text table with a single mask entry for each valid bit in the control enable mask record. A value of 0 in the [DcmDspDidControlMaskBitPosition](#) represents the most significant bit in the most significant byte of the control enable mask. Therefore it is mapped to Bit 7 (0x80) of the first byte of the control enable mask. In a two byte [CEMR](#) the bit position 0 would map to 0x8000, the bit position 1 would map to 0x4000, Also this is a unusual representation it helps to keep the bits stable if the size of the [CEMR](#) is changed. The definition of the bits is directly defined by [DcmDspDidControlEnableMask](#).

8.8.2 Sender-Receiver-Interfaces

Using the concepts of the [SW-C](#) template, the interface is defined as follows if Sender-Receiver interface is used ([DcmDspDataUsePort](#) set to [USE_DATA_SENDER_RECEIVER](#) || [USE_DATA_SENDER_RECEIVER_AS_SERVICE](#)):

8.8.3 Client-Server-Interfaces

8.8.3.1 SecurityAccess_{SecurityLevel}

Provides functions required for the [UDS](#) Service SecurityAccess (see [[SWS_Dcm_00323](#)],[[SWS_Dcm_00862](#)] and [[SWS_Dcm_00863](#)]).

Using the concepts of the [SW-C](#) template, the interface is defined as follows if ClientServer interface is used ([DcmDspSecurityUsePort](#) set to or [USE_ASYNC_CLIENT_SERVER](#)):

[SWS_Dcm_00685] ↗

Name	SecurityAccess_{SecurityLevel}		
Comment	–		
IsService	true		
Variation	{ecuc(Dcm/DcmConfigSet/DcmDsp/DcmDspSecurity/DcmDspSecurityRow.DcmDspSecurityUsePort) == USE_ASYNC_CLIENT_SERVER} SecurityLevel = {ecuc(Dcm/DcmConfigSet/DcmDsp/DcmDspSecurity/DcmDspSecurityRow.SHORT-NAME)}		
Possible Errors	0	E_OK	Operation successful
	1	E_NOT_OK	Operation failed
	10	DCM_E_PENDING	Request is not yet finished. Further call(s) required to finish.
	11	DCM_E_COMPARE_KEY_FAILED	Key did not match.

])

One DataServices interface will be generated for each Data of each DID/PID, with following possible operations:

8.8.3.2.1 **ReadData**

ReadData allows requesting to the application a data value of a DID/PID. A ReadData interface is defined for every data of each DID/PID with read access. The Data specific type is an array of uint8 which represents either the fix length of this Data or the maximum possible length of this Data. If the length is variable, the operation ReadDataLength has to provide the current valid data length of this Data.

This interface is used for [UDS](#) Service ReadDataByIdentifier and for [UDS](#) Service ReadDataByPeriodicIdentifier (0x2A) and for [UDS](#) Service InputOutputControlByIdentifier (0x2F).

The ReadData interface can be defined as synchronous or asynchronous according to configuration parameter [DcmDspDataUsePort](#). The synchronous mechanism of the ReadData interface is compatible to the related DEM interface to allow the provider to use the same interface for both [Dcm](#) and DEM.

8.8.3.2.2 **WriteData**

WriteData requests the application to write a data value of a DID. The Data specific type is an array of uint8 which represent either the fix length of this Data or the maximum possible length of this Data. A WriteData interface is defined for every data of each [DID](#) with write access. This interface is used for the [UDS](#) Service WriteDataByIdentifier (0x2E).

8.8.3.2.3 **ReadDataLength**

ReadDataLength requests the application to return the data length of a Data. A ReadDataLength interface is defined for every data of each [DID](#) with variable data length. This interface is used for [UDS](#) Service ReadDataByIdentifier and for [UDS](#) Service ReadDataByPeriodicIdentifier (0x2A).

8.8.3.2.4 ConditionCheckRead

ConditionCheckRead requests to the application if the conditions (System state,...) to read the Data are correct. This operation is called for all requested DIDs before requesting the data of each DID. A ConditionCheckRead interface is defined for every data of each [DID](#) with read access.

8.8.3.2.5 GetScalingInformation

Request to the application for the scaling information of a Data (see [\[SWS_Dcm_00394\]](#)).

8.8.3.2.6 ReturnControlToEcu

Request to the application to return control to ECU of an IOControl (see [\[SWS_Dcm_00396\]](#)).

8.8.3.2.7 ResetToDefault

Request to the application to reset an IOControl to default value (see [\[SWS_Dcm_00397\]](#)).

8.8.3.2.8 FreezeCurrentState

Request to the application to freeze the current state of an IOControl (see [\[SWS_Dcm_00398\]](#)).

8.8.3.2.9 ShortTermAdjustment

Request to the application to adjust the IO signal (see [\[SWS_Dcm_00399\]](#)).

8.8.3.3 DataServices_DIDRange_{Range}

The following interface defines an operation needed to get the [DID](#) range. Using the concepts of the [SW-C](#) template, the interface is defined as follows:

[\[SWS_Dcm_00769\]](#) ↗

Name	DataServices_DIDRange_{Range}		
Comment	–		
IsService	true		
Variation	{ecuc(Dcm/DcmConfigSet/DcmDsp/DcmDspDidRange.DcmDspDidRangeUsePort)} == TRUE Range = ({ecuc(Dcm/DcmConfigSet/DcmDsp/DcmDspDidRange.SHORT-NAME)})

]()

8.8.3.4 InfotypeServices_{VehInfoData}

The following interface defines an operation needed to get data from one or several SW-C in order to supply OBD Service \$09 (see [SWS_Dcm_00423]).

Using the concepts of the SW-C template, the interface is defined as follows:

[SWS_Dcm_00688] ↴

Name	InfotypeServices_{VehInfoData}		
Comment	–		
IsService	true		
Variation	{ecuc(Dcm/DcmConfigSet/DcmDsp/DcmDspVehInfo/DcmDspVehInfoData/DcmDspVehInfoDataUsePort)==TRUE VehInfoData = {ecuc(Dcm/DcmConfigSet/DcmDsp/DcmDspVehInfo/DcmDspVehInfoData.SHORT-NAME)}		
Possible Errors	0	E_OK	Operation successful
	1	E_NOT_OK	Operation failed
	10	DCM_E_PENDING	Request is not yet finished. Further call(s) required to finish.

Operation	GetInfotypeValueData		
Comment	–		
Variation	–

	12	DCM_E_FORCE_RCRRP	application request the transmission of a response Response Pending (NRC 0x78)

Operation	ProcessRequestAddFile		
Comment	Callout function. DCM shall call this function to start a RequestFileTransfer process with modeOfOperation equal to 0x01 (AddFile).		
Variation	–		
	OpStatus		
	Type	Dcm_OpStatusType	

Direction	IN
Comment	DCM_INITIAL: All In-parameters are valid. DCM_PENDING: All In-parameters are set to 0x00. DCM_CANCEL: All In-parameters are set to 0x00. DCM_FORCE_RCRRP_OK: All In-parameters are set to 0x00.
Variation	–
filePathAndNameLength	
Type	uint16
Direction	IN
Comment	Defines the length in bytes for the parameter filePathAndName.
Variation	–
filePathAndName	
Type	const Dcm_FileAndDirNameType
Direction	IN
Comment	Defines the file system location of the server where the file which shall be added, deleted, replaced or read from depending on the parameter modeOf Operation parameter. In addition this parameter includes the file name of the file which shall be added, deleted, replaced or read as part of the file path.
Variation	–
dataFormatIdentifier	
Type	uint8
Direction	IN
Comment	This data-parameter is a one byte value with each nibble encoded separately. The high nibble specifies the "compressionMethod", and the low nibble specifies the "encryptingMethod". The value 0x00 specifies that neither compressionMethod nor encryptingMethod is used. Values other than 0x00 are vehicle manufacturer specific.
Variation	–
fileSizeUncompressed	
Type	uint64
Direction	IN
Comment	Defines the size of the uncompressed file to be download in bytes.
Variation	–
fileSizeCompressed	
Type	uint64
Direction	IN
Comment	Defines the size of the compressed file to be downloaded in bytes.
Variation	–
maxNumberOfBlockLength	
Type	uint64
Direction	OUT
Comment	Max number of bytes to be included in each TransferData request excluding the SID and the blockSequenceCounter.
Variation	–
ErrorCode	
Type	Dcm_NegativeResponseCodeType
Direction	OUT

	Comment	If the operation Dcm_ProcessRequestAddFile returns value E_NOT_OK, the DCM module shall send a negative response with NRC code equal to the parameter ErrorCode parameter value.
	Variation	–
Possible Errors	E_OK E_NOT_OK DCM_E_PENDING DCM_E_FORCE_RCRRP	

Operation	ProcessRequestDeleteFile	
Comment	Callout function. DCM shall call this function to start a RequestFileTransfer process with modeOfOperation equal to 0x02 (DeleteFile).	
Variation	–	
Parameters	OpStatus	
	Type	Dcm_OpStatusType
	Direction	IN
	Comment	DCM_INITIAL: All In-parameters are valid. DCM_PENDING: All In-parameters are set to 0x00. DCM_CANCEL: All In-parameters are set to 0x00. DCM_FORCE_RCRRP_OK: All In-parameters are set to 0x00.
	Variation	–
	filePathAndNameLength	
	Type	uint16
	Direction	IN
	Comment	Defines the length in bytes for the parameter filePathAndName.
	Variation	–
filePathAndName	filePathAndName	
	Type	const Dcm_FileAndDirNameType
	Direction	IN
	Comment	Defines the file system location of the server where the file which shall be added, deleted, replaced or read from depending on the parameter modeOfOperation parameter. In addition this parameter includes the file name of the file which shall be added, deleted, replaced or read as part of the file path.
	Variation	–
	ErrorCode	
ErrorCode	Type	Dcm_NegativeResponseCodeType
	Direction	OUT
	Comment	If the operation Dcm_ProcessRequestDeleteFile returns value E_NOT_OK, the DCM module shall send a negative response with NRC code equal to the parameter ErrorCode parameter value.
	Variation	–
Possible Errors	E_OK E_NOT_OK DCM_E_PENDING DCM_E_FORCE_RCRRP	

Operation	ProcessRequestReadDir																																																														
Comment	<p>Callout function.</p> <p>DCM shall call this function to start a RequestFileTransfer process with modeOfOperation equal to 0x05 (ReadDir).</p>

8.8.5 Ports

This section formally specifies the corresponding AUTOSAR Service using the concepts of the Software-Component-Template. The following definition can be generated completely out of the configuration of the Dcm, which defines the exact ports that are present and their names.

Naming of the port : The prefix of the port name is fixed and defined herafter (e.g. DataServices_). The name behind the prefix corresponds to the name of the associated container in the ECU configuration and can be freely defined during the configuration step. e.g. : for a [DcmDspData](#) container called Speed the port name would be DataServices_Speed

```

1  ServiceSwComponentType Dcm {
2
3    //the presence and name of this port is configuration-independent
4    ProvidePort DCMServices DCMServices;
5
6    //see configuration parameter DcmDspSecurityRow
7    RequirePort SecurityAccess_{SecurityLevel\} SecurityAccess_{\{
8      SecurityLevel\};
9
10   ...
11
12   //see configuration parameter DcmDspData
13  RequirePort DataServices_{\{Data\}} DataServices_{\{Data\}};
14  ProvidePort DataServices_{\{Data\}} DataServices_{\{Data\}}; // Only if
15    the data can be written and DcmDspDataUsePort is set to
16    USE_DATA_SENDER_RECEIVER or to USE_DATA_SENDER_RECEIVER_AS_SERVICE
17
18   ...
19
20   //see configuration parameter DcmDspVehInfoData

```

```
18  RequirePort InfotypeServices_{VehInfoData}
19      InfotypeServices_{VehInfoData}

8.9 External diagnostic service processing

The following chapter applies only to external processed diagnostic services.

8.9.1 <Module>_<DiagnosticService>

[SWS_Dcm_00763] [

Service Name	<Module>_<DiagnosticService>
Syntax	Std_ReturnType <Module>_<DiagnosticService> (Dcm_ExtendedOpStatusType OpStatus, Dcm_MsgContextType* pMsgContext, Dcm_NegativeResponseCodeType* ErrorCode)
Service ID [hex]	0x32
Sync/Async	Asynchronous
Reentrancy	Reentrant

Parameters (in)	OpStatus	DCM_INITIAL DCM_PENDING DCM_CANCEL DCM_FORCE_RCRP_OK DCM_POS_RESPONSE_SENT DCM_POS_RESPONSE_FAILED DCM_NEG_RESPONSE_SENT DCM_NEG_RESPONSE_FAILED
Parameters (inout)	pMsgContext	Message-related information for one diagnostic protocol identifier. The pointers in pMsgContext shall point behind the SID.
Parameters (out)	ErrorCode	If the operation <Module>_<DiagnosticService> returns value E_NOT_OK, the Dcm module shall send a negative response with NRC code equal to the parameter ErrorCode parameter value.
Return value	Std_ReturnType	E_OK: Request was successful E_NOT_OK: Request was not successful DCM_E_PENDING: Request is not yet finished DCM_E_FORCE_RCRP: Application requests the transmission of a response Response Pending (NRC 0x78)
Description	Callout function. The Dcm shall call this callout function as soon as valid message is received on relevant DcmDslProtocolRxPduld on SID level. The usecase of multiple diagnostic protocols will be possible by using different arguments and the function shall be programmed in a way that it is reentrant. Caller is responsible for the lifetime of the argument pMsgContext. The name of the callout is defined within parameter DcmDsdSidTabFnc	
Available via	Dcm_Externals.h

Parameters (in)	OpStatus	DCM_INITIAL DCM_PENDING DCM_CANCEL DCM_FORCE_RCRP_OK DCM_POS_RESPONSE_SENT DCM_POS_RESPONSE_FAILED DCM_NEG_RESPONSE_SENT DCM_NEG_RESPONSE_FAILED
Parameters (inout)	pMsgContext	Message-related information for one diagnostic protocol identifier. The pointers in pMsgContext shall point behind the SID.
Parameters (out)	ErrorCode	If the operation <Module>_<DiagnosticService>_<SubService> returns value E_NOT_OK, the Dcm module shall send a negative response with NRC code equal to the parameter ErrorCode parameter value.
Return value	Std_ReturnType	E_OK: Request was successful E_NOT_OK: Request was not successful DCM_E_PENDING: Request is not yet finished DCM_E_FORCE_RCRP: Application requests the transmission of a response Response Pending (NRC 0x78)

Description	Callout function. If a DcmDsdSubServiceFnc is configured for the received subservice, the Dcm shall call this callout function as soon as this subservice is requested. The usecase of multiple diagnostic protocols will be possible by using different arguments and the function shall be programmed in a way that it is reentrant. Caller is responsible for the lifetime of the argument pMsgContext. The name of the callout is defined within parameter DcmDsdSubServiceFnc.
Available via	Dcm_Externals.h

]()

8.10 Internal interfaces (not normative)

The following interfaces are used in the [Dcm](#) SWS in order to improve the understanding of the [Dcm](#) module behavior. An implementation is not required to use these interfaces.

8.10.1 DsIInternal_SetSecurityLevel

```
1 void
2 DsIInternal_SetSecurityLevel (Dcm_SecLevelType SecurityLevel)
```

This function sets a new security level value in the [Dcm](#) module. NOTE: for the definition of the parameter, refer to [Dcm_GetSecurityLevel](#).

8.10.2 DsIInternal_SetSesCtrlType

```
1 void
2 DsIInternal_SetSesCtrlType (Dcm_SesCtrlType SesCtrlType)
```

This function sets a new session control type value in the [Dcm](#) module. NOTE: for the definition of the parameter, refer to the [Dcm_GetSesCtrlType](#).

8.10.3 DsPIInternal_DcmConfirmation

```
1 void
2 DsPIInternal_DcmConfirmation (Dcm_IdContextType idContext,
3 uint16 ConnectionId
4 Dcm_ConfirmationStatusType status)
```

This function confirms the successful transmission or a transmission error of a diagnostic service. This is the right time to perform any application state transitions.

This [API](#) is also called if the response to a diagnostic service is suppressed.

8.10.4 DsIInternal_ResponseOnOneEvent

```
1 Dcm_StatusType
2 DsIInternal_ResponseOnOneEvent (const Dcm_MsgType MsgPtr,
3 Dcm_MsgLenType MsgLen,
```

```
4  uint16 ConnectionId)
```

This [API](#) executes the processing of one event, requested internally in the DCM.

8.10.5 DsIInternal_ResponseOnOneDataByPeriodicId

```
1  Dcm_StatusType
2  DsIInternal_ResponseOnOneDataByPeriodicId(uint8 PeriodicId)
```

This [API](#) provides the processing of one periodic [ID](#) event, requested internally in the DCM. The frequency of calling this function depends on the rate given in the original [ReadDataByPeriodicID](#) request (parameter [transmissionMode](#)).

8.10.6 DsdInternal_StartPagedProcessing

```
1  void
2  DsdInternal_StartPagedProcessing(const Dcm_MsgContextType* pMsgContext)
```

With this API, the [DSP](#) submodule gives the complete response length to the [Dcm](#) module and starts paged-buffer handling. This [API](#) starts no transmission!

8.10.7 DspInternal_CancelPagedBufferProcessing

```
1  void
2  DspInternal_CancelPagedBufferProcessing()
```

[Dcm](#) informs [DSP](#), that processing of paged-buffer was cancelled due to errors. Upon this call, [DSP](#) is not allowed to process further on paged-buffer handling.

8.10.8 DsdInternal_ProcessPage

```
1  void
2  DsdInternal_ProcessPage(Dcm_MsgLenType FilledPageLen)
```

[DSP](#) requests transmission of filled page.

9 Sequence diagrams

9.1 Overview

For clarification, the following sequence diagrams don't represent the full communication mechanism between the [Dcm](#) module and the [PduR](#) module. This is to keep the sequence diagrams simple. Before the [Dcm_TpRxIndication](#) call, the [PduR](#) module will ask the [Dcm](#) module for a buffer by calling [Dcm_StartOfReception](#) and [Dcm_CopyRxData](#). This exchange is not shown on the next sequence diagrams. After a [PduR_DcmTransmit\(\)](#) request from the [Dcm](#) module to the [PduR](#) module, data exchanges with [Dcm_CopyTxData](#) service, are not shown in the sequence diagrams. The function [Xxx_StartProtocol\(\)](#) shall be called with the very first diagnostic request.

9.2 DSL (Diagnostic Session Layer)

9.2.1 Start Protocol

Figure 9.1

9.2.2 Process Busy behavior

Figure 9.2

Internally, the **D_{SL}** submodule calculates the time to response the tester. In the case that the external module processing the request doesn't close the request by returning **E_OK** or **E_NOT_OK** to **<Module>_<DiagnosticService>()** or **<Module>_<DiagnosticService>_<SubService>()** APIs call (in case of normal response handling) or **DsdInternal_ProcessPage()** (in case of paged-buffer handling) during the **P2ServerMax** and/or **P2*ServerMax**, the **D_{SL}** submodule sends a negative response (**requestCorectlyReceived-ResponsePending**) independently.

9.2.3 Update Diagnostic Session Control when timeout occurs

Figure 9.3

The [DSL](#) submodule resets session control value to default, if in a non-default session S3server timeout occurs. S3server timeout timer will be started with every data confirmation from the PduR module.

9.2.4 Process single response of ReadDataByPeriodicIdentifier

Figure 9.4

The **DSP** submodule requests sampling and transmission of Periodic Identifier data, when an event to Periodic Identifier occurs (i. e. a given time period is over). The **DSP** submodule initiates the sending of one periodic identifier calling the function `ResponseOnOneDataByPeriodicId()` provided by the **DSL** submodule.

Within this function the **DSL** submodule simulates a "ReadDataByIdentifier" request for the given PeriodicId. The High byte of the DataIdentifier shall be set to 0xF2 as specified in [18]) and the low byte is set to value of the PeriodicId.

The ReadData interfaces of the corresponding Data of the **DID** are called to get the **DID** value. The **Dcm** module is not able to receive for the same periodic identifier another event request from the **DSP** submodule, unless the confirmation of the current transmission is received.

9.2.5 Process single event-triggered response of ResponseOnEvent

Figure 9.5

This sequence diagram shows an example for ResponseOnEvent. ResponseOnEvent is setup and started for onDTCStatusChange. Event changes are reported to the Dcm which will trigger a serviceToRespondTo.

9.2.6 Process concurrent requests

Figure 9.6

On reception of [OBD](#) request in parallel to processing of a normal diagnostic request (e.g. enhanced diagnostic protocol, customer diagnostic protocol), running diagnostic request will be preempted. This is due to the configured higher priority of [OBD](#) protocol (see configuration parameter [DcmDslProtocolPriority](#)).

The following is processed on reception of 1st [OBD](#) request:

- The Application is informed of the protocol stop (done with `Xxx_StopProtocol()`) and resets to a stable state (e.g. switch of digital los,...).
- Lower Layer is requested to cancel ongoing transmission on the same N-PDU (done with `PduR_DcmCancelTransmit()`).

- If the `Dcm` is not able to switch fast enough from non `OBD` to `OBD` protocol, the `DSL` submodule responds with a negative response "BusyRepeatRequest" (NRC 0x21) to `OBD` tester. It is in the responsibility of the system designer to ensure that the legislative timings are satisfied.

As long as the external module processing the request is not finished (finish is indicated by returning `E_OK` or `E_NOT_OK` to `<Module>_<DiagnosticService>()/<Module>_<DiagnosticService>_<SubService>()` API call) or no timeout occurs, the `DSL` submodule responses with negative response "BusyRepeatRequest".

With receiving `E_OK` or `E_NOT_OK` from the external module to `<Module>_<DiagnosticService>()/<Module>_<DiagnosticService>_<SubService>()` API call, the `DSL` submodule will not transmit a response to old request. There will also not given any negative response to inform first tester about preemption of diagnostic request.

If the external module processing the request never returns `E_OK` or `E_NOT_OK` to `<Module>_<DiagnosticService>()/<Module>_<DiagnosticService>_<SubService>()` API call, the `DSL` submodule runs into timeout and switches directly to further processing of preempting protocol.

9.2.7 Interface to ComManager

9.2.7.1 Handling in Default Session

Figure 9.7

9.2.7.2 Handling in Non-Default Session

Figure 9.8

9.2.7.3 Session transitions

Figure 9.9

9.2.7.4 Communication States

Figure 9.10

[DSD](#) (Diagnostic Service Dispatcher) Receive a request message and transmit a positive response message - synchronous transmission

Figure 9.11

Receive a request message and transmit a positive response message - asynchronous transmission

Figure 9.12

Receive a request message and suppress a positive response

Figure 9.13

9.2.8 Receive request message and transmit negative response message

Figure 9.14

9.2.9 Process Service Request with paged-buffer

Figure 9.15

The following flow is processed in case no error occurs on the Application side:

Start of process:

- 4) `DsdlInternal_StartPagedProcessing()`: With this API, the `DSP` submodule gives the complete response length to the `Dcm` module and starts paged-buffer handling. This API starts no transmission!
- 5) `UpdatePage()`: The `Dcm` module requests data to be transmitted.
- 6) `DsdlInternal_ProcessPage()`: With this API, the `DSP` submodule requests transmission of the current page.
- 8) `PduR_DcmTransmit()`: The `Dcm` module requests transmission to the lower layers.
- 9) `Dcm_CopyTxData`: The buffer is filled and the `Dcm` module shall return "BUFREQ_OK"(10).

Start of the loop:

- 11) `Dcm_CopyTxData`: The `PduR` module requests the buffer but the buffer is not filled by the `DSP` submodule.
- 12 + 13) `UpdatePage`: The `Dcm` module requests the `DSP` submodule to fill the next page.
- 14) By returning "BUFREQ_E_BUSY", the `Dcm` module indicates that the buffer has to be filled by the `DSP` submodule.
- 15) `DsdlInternal_ProcessPage()`: With this API, the `DSP` submodule requests transmission of the current page.
- 17) Then, on the next call of `Dcm_CopyTxData` the buffer is filled and the `Dcm` module shall return "BUFREQ_OK" (18).

LOOP: The flow 10 to 18 is repeated as long data can be sent.

End of the loop:

n-2 -> n) `Dcm_TpTxConfirmation` When all data is send, the `PduR` module indicates the sending with a confirmation, which is given to the `DSP` submodule.

The APIs 4, 5 and 6 are needed only for paged-buffer transmission.

Page buffer timeout handling:

The `Dcm` module reacts in the following described way, when the `DSP` submodule starts paged-buffer handling, but is not able to process further on filling the response data. E.g. there are problems to access data from an EEPROM device. When providing the Pagebuffer to the `DSP` submodule (13: `UpdatePage()`), and getting a negative Tx confirmation from underlying Transport Layers, the following error handling is carried out in the `Dcm` module:

- The `Dcm` module stops further processing of paged-buffer (item 15),
- The `Dcm` module requests the `DSP` submodule (14: `DsdlInternal_CancelPagedBufferProcessing()`) to stop further processing of PagedBuffer.

Figure 9.16

9.2.10 Process copy data in reception

Please refer to Figure 9 "CanTp I-PDU reception" in [11, SWS PduR].

9.2.11 Process copy data in transmission

Please refer to Figure 14 "CanTp I-PDU transmission" in [11, SWS PduR].

9.3 DSP (Diagnostic Service Processing)

9.3.1 Interface DSP - DEM (service 0x19, 0x14, 0x85)

Please refer to Section 9 in [13, SWS Dem].

9.3.2 Interface special services

9.3.2.1 Process Diagnostic Session Control

Figure 9.17

Above sequence diagram shows processing of Diagnostic Session Control request from a tester. Note that the new diagnostic session and timing parameters only apply after the transmission confirmation of the server positive response

9.3.2.2 Process Tester Present

Figure 9.18

Above sequence diagram shows processing of TesterPresent commands, which are not of type functional addressed with subfunction 0x80. These TesterPresent commands are interpreted in the [DSL](#) submodule (more details can be found in Section [7.4.4.3 Concurrent TesterPresent keep alive logic](#)).

All the other TesterPresent commands are processed in the following way: On a command TesterPresent the [DSD](#) submodule calls the [DSP](#) submodule with the function TesterPresent(). The sequence chart also shows the case when an error occurs and a negative response is sent.

9.3.2.3 Process Security Access

Figure 9.19

To get the security access, the **DSD** submodule has to call the **DSP** submodule to get the seed value from the application. If no error is detected, the seed value is sent in the positive response.

In a second step, the **DSP** submodule gets the key calculated by the tester and requests the application to compare this key with the internal calculated key. If no error occurs, the new access type is set in the **DSL** submodule and a positive response is sent.

9.3.2.4 Process ResponseOnEvent OnDtcChange

Figure 9.20

Above sequence diagram shows processing of ResponseOnEvent service for subservice OnDtcChange.

After configuration and activation of the event by the service ResponseOnEvent, the Dcm checks the status of the configured DTC on every call to interface `Dcm_DemTriggerOnDTCStatus` in order to identify if the event shall be triggered. This interface is called by DEM for any DTC status change and independently of the activation/deactivation of ResponseOnEvent.

9.3.2.5 Process ResponseOnEvent OnChangeOfDataIdentifier

Figure 9.21

Above sequence diagram shows processing of ResponseOnEvent service for sub-service OnChangeOfDataIdentifier in the case the event is externally managed (The event can be internally managed, but is not described in this diagram).

After configuration and external activation of the event by the service ResponseOnEvent, the Dcm wait to be triggered by the external module managing this DID.

9.3.2.6 Process Jump to Bootloader

Figure 9.22

Above sequence diagram shows processing of a jump to bootloader on reception of DiagnosticSessionControl. On reception of DiagnosticSessionControl, the [Dcm](#) checks if the requested session is configured to trigger a jump to bootloader. In positive case, the [Dcm](#) start the jump to bootloader process:

- Transmission of [NRC 0x78 \(ResponsePending\)](#)
- On confirmation of transmission of [NRC 0x78](#), the [Dcm](#) calls the callout [DcmSetProgConditions](#) to store all information needed for the bootloader

10 Configuration specification

In general, this chapter defines configuration parameters and their clustering into containers. In order to support the specification Chapter 10.1 describes fundamentals.

It also specifies a template (table) you shall use for the parameter specification. We intend to leave Chapter [10.1](#) in the specification to guarantee comprehension.

Chapter [10.2](#) specifies the structure (containers) and the parameters of the module <MODULE_ABBREVIATION>.

Chapter [10.4](#) specifies published information of the module <MODULE_ABBREVIATION>.

10.1 How to read this chapter

For details refer to the chapter 10.1 "Introduction to configuration specification" in SWS_BSWGeneral [\[7\]](#).

10.2 Containers and configuration parameters

The following chapters summarize all configuration parameters. The detailed meanings of the parameters describe Chapter [7](#) and Chapter [8](#).

Figure 10.1: Configuration overview

10.2.1 Dcm

Module SWS Item	ECUC_Dcm_01082	
Module Name	Dcm	
Module Description	Configuration of the Dcm (Diagnostic Communications Manager) module.	
Post-Build Variant Support	true	
Supported Config Variants	VARIANT-LINK-TIME, VARIANT-POST-BUILD, VARIANT-PRE-COMPIL	
Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmConfigSet	1	This container contains the configuration parameters and sub containers of the DCM module supporting multiple configuration sets.
DcmGeneral	1	Contains general configuration parameters valid for the entire Dcm module.

10.2.2 DcmConfigSet

SWS Item	[ECUC_Dcm_00819]	
Container Name	DcmConfigSet	
Parent Container	Dcm	
Description	This container contains the configuration parameters and sub containers of the DCM module supporting multiple configuration sets.	
Configuration Parameters		

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDsd	1	These parameters configure the Diagnostic Service Dispatcher submodule.
DcmDsl	1	These parameters configure the Diagnostic Session Layer submodule.
DcmDsp	0..1	These parameters apply to Diagnostic Service Processing. There will always be one set of these parameters per Dcm. Please note: Although the multiplicity is set to 0..1. It can be expected that this container exists in any valid DCM configuration.
DcmPageBufferCfg	1	This container contains the configuration (parameters) for Page Buffer handling
DcmProcessing Conditions	0..1	This container contains the configuration for mode arbitration functionality of the Dcm

10.2.2.1 DcmPageBufferCfg

SWS Item	[ECUC_Dcm_00775]	
Container Name	DcmPageBufferCfg	
Parent Container	DcmConfigSet	
Description	This container contains the configuration (parameters) for Page Buffer handling	
Configuration Parameters		

Name	DcmPagedBufferEnabled [ECUC_Dcm_00776]		
Parent Container	DcmPageBufferCfg		
Description	Allow to enable or disable the Paged buffer mechanism. true = Paged buffer handling enabled false = Paged Buffer handling disabled		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

No Included Containers

Figure 10.2: DcmPageBufferCfg configuration overview

10.2.2.2 DcmProcessingConditions

SWS Item	[ECUC_Dcm_00932]
Container Name	DcmProcessingConditions
Parent Container	DcmConfigSet
Description	This container contains the configuration for mode arbitration functionality of the Dcm
Configuration Parameters	

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmModeCondition	1..*	<p>This container contains the configuration of a mode condition or an environmental conditions which can be used as argument in DcmModeRules.</p> <p>One DcmModeCondition shall contain either one DcmSwcModeRef or one DcmBswModeRef or one DcmSwcSRDataElementRef.</p> <p>Please note that the Dcm acts as well as mode manager. Therefore the references DcmSwcModeRef or one DcmBswModeRef. might point to provided ModeDeclarationGroupPrototypes of the Dcm itself as well as to provided ModeDeclarationGroupPrototypes of other Bsw Modules or software components.</p> <p>In case of a configured DcmSwcModeRef or DcmBswModeRef only the DcmConditionType DCM_EQUALS or DCM_EQUALS_NOT are applicable.</p> <p>In case of DcmSwcSRDataElementRef all literals of DcmConditionType are possible.</p>
DcmModeRule	1..*	<p>This container contains the configuration of a mode rule which represents a logical expression with DcmModeConditions or other DcmModeRules as arguments.</p> <p>All arguments are processed with the operator defined by DcmLogicalOperator, for instance: Argument_A AND Argument_B AND Argument_C</p>

Figure 10.3: DcmDspProcessingConditions1 configuration overview

Figure 10.4: DcmDspProcessingConditions2 configuration overview

10.2.3 DcmDsd

10.2.3.1 DcmDsd

SWS Item	[ECUC_Dcm_00688]
Container Name	DcmDsd
Parent Container	DcmConfigSet
Description	These parameters configure the Diagnostic Service Dispatcher submodule.
Configuration Parameters	

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDsdServiceRequest ManufacturerNotification	0..*	<p>The name of this container is used to define the name of the R-Port through which the DCM accesses the interface ServiceRequestNotification. The R-Port is named ServiceRequestManufacturerNotification_{Name} where {Name} is the name of the container DcmDsdServiceRequestManufacturerNotification.</p> <p>The lowerMultiplicity is 0: If container DcmDsdServiceRequestManufacturerNotification does not exist the Indication API is not available.</p>
DcmDsdServiceRequest SupplierNotification	0..*	<p>The name of this container is used to define the name of the R-Port through which the DCM accesses the interface ServiceRequestNotification. The R-Port is named ServiceRequestSupplierNotification_{SWC} where <SWC> is the name of the container DcmDsdServiceRequestSupplierNotification.</p> <p>The lowerMultiplicity is 0: If the container DcmDsdRequestSupplierNotification does not exist the Indication API is not available.</p>
DcmDsdServiceTable	1..256	<p>This container contains the configuration (DSD parameters) for a Service Identifier Table.</p> <p>Note: It is allowed to add OBD services to a DcmDsdServiceTable related to a UDS Protocol. But it is not allowed to add UDS services to a DcmDsdServiceTable related to an OBD Protocol.</p>

Figure 10.5: DcmDsd configuration overview

Figure 10.6: DcmDsdIndication configuration overview

10.2.3.2 DcmDsdService

SWS Item	[ECUC_Dcm_00689]
Container Name	DcmDsdService
Parent Container	DcmDsdServiceTable
Description	This container contains the configuration (DSD parameters) for a Service.
Configuration Parameters	

Name	DcmDsdServiceRole [ECUC_Dcm_01139]		
Parent Container	DcmDsdService		
Description	Bitfield where each bit represents one dedicated role. A diagnostic service is granted access if the bit value is 1. If a bit value is 0, the service is not allowed to be executed for that role.		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	0 .. 4294967295		
Default Value			
Post-Build Variant Multiplicity	true		
Post-Build Variant Value	true		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL

Included Containers			
Container Name	Multiplicity	Scope / Dependency	
DcmDsdSubService	0..*	This container contains the configuration (DSD parameters) for a subservice of a service. Only those services may have subservices, which have the DcmDsdSidTabSubfuncAvail configured as TRUE.	

10.2.3.3 DcmDsdServiceRequestManufacturerNotification

SWS Item	[ECUC_Dcm_00681]		
Container Name	DcmDsdServiceRequestManufacturerNotification		
Parent Container	DcmDsd		
Description	<p>The name of this container is used to define the name of the R-Port through which the DCM accesses the interface ServiceRequestNotification. The R-Port is named ServiceRequestManufacturerNotification_{Name} where {Name} is the name of the container DcmDsdServiceRequestManufacturerNotification.</p> <p>The lowerMultiplicity is 0: If container DcmDsdServiceRequestManufacturerNotification does not exist the Indication API is not available.</p> <p>Attributes: requiresIndex=true</p>		
Configuration Parameters			

No Included Containers
10.2.3.4 DcmDsdServiceRequestSupplierNotification

SWS Item	[ECUC_Dcm_00816]
Container Name	DcmDsdServiceRequestSupplierNotification
Parent Container	DcmDsd
Description	<p>The name of this container is used to define the name of the R-Port through which the DCM accesses the interface ServiceRequestNotification. The R-Port is named ServiceRequestSupplierNotification_<SWC> where <SWC> is the name of the container DcmDsdServiceRequestSupplierNotification.</p> <p>The lowerMultiplicity is 0: If the container DcmDsdRequestSupplierNotification does not exist the Indication API is not available.</p> <p>Attributes: requiresIndex=true</p>
Configuration Parameters	

No Included Containers
10.2.3.5 DcmDsdServiceTable

SWS Item	[ECUC_Dcm_00732]
Container Name	DcmDsdServiceTable
Parent Container	DcmDsd
Description	<p>This container contains the configuration (DSD parameters) for a Service Identifier Table.</p> <p>Note: It is allowed to add OBD services to a DcmDsdServiceTable related to a UDS Protocol. But it is not allowed to add UDS services to a DcmDsdServiceTable related to an OBD Protocol.</p>
Configuration Parameters	

Name	DcmDsdSidTabId [ECUC_Dcm_00736]	
Parent Container	DcmDsdServiceTable	
Description	Due to using possibly more service tables, the unique DcmDsdSidTabId can be used to identify them.	
Multiplicity	1	
Type	EcucIntegerParamDef	
Range	0 .. 255	
Default Value		
Post-Build Variant Value	false	

Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDsdService	1..*	This container contains the configuration (DSD parameters) for a Service.

Note : The [Dcm](#) internal interaction with the [DSP](#) is implementation specific and therefore not explicitly configured.

10.2.3.6 DcmDsdSubService

SWS Item	[ECUC_Dcm_00802]
Container Name	DcmDsdSubService
Parent Container	DcmDsdService
Description	This container contains the configuration (DSD parameters) for a subservice of a service. Only those services may have subservices, which have the DcmDsdSidTabSubfuncAvail configured as TRUE.
Configuration Parameters	

Name	DcmDsdSubServiceFnc [ECUC_Dcm_00942]		
Parent Container	DcmDsdSubService		
Description	Callback function of the ECU Supplier specific component for the particular service. The function's prototype is as described for <Module>_<DiagnosticService>_<SubService>. If this parameter is not configured, the subservice is handled Dcm-internally.		
Multiplicity	0..1		
Type	EcucFunctionNameDef		
Default Value			
Regular Expression			
Post-Build Variant Multiplicity	false

10.2.4 DcmDsl

10.2.4.1 DcmDsl

SWS Item	[ECUC_Dcm_00690]
Container Name	DcmDsl
Parent Container	DcmConfigSet
Description	These parameters configure the Diagnostic Session Layer submodule.
Configuration Parameters	

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDslBuffer	1..256	This container contains the configuration of a diagnostic buffer.
DcmDslCallbackDCMRequestService	0..*	Each DcmDslCallbackDCMRequestService container defines an R-Port with the CallbackDCMRequestServices interface which the Dcm uses to ask permission for protocol changes from the application software. The R-Port has the name CallbackDCMRequestServices_<SWC> where <SWC> is the name of this container.
DcmDslDiagResp	1	This container contains the configuration of the automatic requestCorrectlyReceivedResponsePending response management in the Dcm.
DcmDslProtocol	1	This container contains the configurations of the diagnostic protocols used in Dcm.

Figure 10.8: DcmDsl configuration overview

10.2.4.2 DcmDslBuffer

SWS Item	[ECUC_Dcm_00739]
Container Name	DcmDslBuffer
Parent Container	DcmDsl
Description	This container contains the configuration of a diagnostic buffer.
Configuration Parameters	

Name	DcmDslBufferSize [ECUC_Dcm_00738]		
Parent Container	DcmDslBuffer		
Description	<p>Size of the diagnostic buffer in bytes.</p> <p>For a linear buffer the size shall be as large as the longest diagnostic message (request or response).</p> <p>For a paged buffer the size has impacts on the application performance.</p>		
Multiplicity	1		
Type	EcucIntegerParamDef

10.2.4.3 DcmDslCallbackDCMRequestService

SWS Item	[ECUC_Dcm_00679]
Container Name	DcmDslCallbackDCMRequestService
Parent Container	DcmDsl
Description	Each DcmDslCallbackDCMRequestService container defines an R-Port with the CallbackDCMRequestServices interface which the Dcm uses to ask permission for protocol changes from the application software. The R-Port has the name CallbackDCMRequestServices_<SWC> where <SWC> is the name of this container.

Configuration Parameters

No Included Containers

10.2.4.4 DcmDslDiagResp

SWS Item	[ECUC_Dcm_00691]
Container Name	DcmDslDiagResp
Parent Container	DcmDsl
Description	This container contains the configuration of the automatic requestCorrectlyReceivedResponsePending response management in the Dcm.
Configuration Parameters	

Name	DcmDslDiagRespMaxNumRespPend [ECUC_Dcm_00693]		
Parent Container	DcmDslDiagResp		
Description	Maximum number of negative responses with response code 0x78 (requestCorrectlyReceivedResponsePending) allowed for a request. If Dcm reaches this limit, an automatic 0x10 (generalReject) final response will be transmitted and the service processing will be cancelled. Value 0x00 means that no NRC 0x78 response will be transmitted.		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	0 .. 255		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

Name	DcmDslDiagRespOnSecondDeclinedRequest [ECUC_Dcm_00914]		
Parent Container	DcmDslDiagResp		
Description	Defines the reaction upon a second request (ClientB) that can not be processed (e.g. due to priority assessment). TRUE: when the second request (Client B) can not be processed, it shall be answered with NRC21 BusyRepeatRequest. FALSE: when the second request (Client B) can not be processed, it shall not be responded.		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default Value

10.2.4.8 DcmDslMainConnection

SWS Item	[ECUC_Dcm_00706]
Container Name	DcmDslMainConnection
Parent Container	DcmDslConnection
Description	This container contains the configuration for a main connection of a diagnostic protocol. Additionally it may contain references to ROE and Periodic connections if the protocol type or protocol transmission type needs them.
Configuration Parameters	

Name	DcmDslProtocolRxConnectionId [ECUC_Dcm_00826]		
Parent Container	DcmDslMainConnection		
Description	Unique identifier of the tester which uses this connection for diagnostic communication.		
Multiplicity	1		
Type	EcclIntegerParamDef (Symbolic Name generated for this parameter)		
Range	0 .. 65535		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDslProtocolRxTesterSourceAddr [ECUC_Dcm_01115]		
Parent Container	DcmDslMainConnection		
Description	Tester source address uniquely describes a client and will be used e.g. within the jump to Bootloader interfaces. This parameter is not required for generic connections (DcmPdus with MetaDataLength >= 1).		
Multiplicity	0..1		
Type	EcclIntegerParamDef		
Range	0 .. 65535		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	

Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

Name	DcmDslPeriodicTransmissionConRef [ECUC_Dcm_00707]		
Parent Container	DcmDslMainConnection		
Description	Reference to a periodic transmission connection which is used for the processing of periodic transmission events.		
Multiplicity	0..1		
Type	Reference to DcmDslPeriodicTransmission		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	-	
	Post-build time	-	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

Name	DcmDslProtocolComMChannelRef [ECUC_Dcm_00952]		
Parent Container	DcmDslMainConnection		
Description	Reference to the ComMChannel on which the DcmDslProtocolRxPdu is received and the DcmDslProtocolTxPdu is transmitted.		
Multiplicity	1		
Type	Symbolic name reference to ComMChannel		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

Name	DcmDslROEConnectionRef [ECUC_Dcm_00708]		
Parent Container	DcmDslMainConnection		
Description	Reference to a ResponseOnEvent connection which is used for the processing of ResponseOnEvent events.		
Multiplicity	0..1		
Type	Reference to DcmDslResponseOnEvent		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Included Containers			
Container Name	Multiplicity	Scope / Dependency	
DcmDslProtocolRx	1..*	This container contains the configuration parameters of a reception channel in a diagnostic connection. The PDU referenced by this reception channel can consume meta data items of type SOURCE_ADDRESS_16 and TARGET_ADDRESS_16.	
DcmDslProtocolTx	0..1	This container contains the configuration parameters of a transmission channel in a diagnostic connection. The PDU referenced by this transmission channel can produce meta data items of type TARGET_ADDRESS_16 and SOURCE_ADDRESS_16.	

Figure 10.13: DcmDslMainConnection configuration overview

10.2.4.9 DcmDslProtocolRx

SWS Item	[ECUC_Dcm_00709]
Container Name	DcmDslProtocolRx
Parent Container	DcmDslMainConnection

Description	<p>This container contains the configuration parameters of a reception channel in a diagnostic connection.</p> <p>The PDU referenced by this reception channel can consume meta data items of type SOURCE_ADDRESS_16 and TARGET_ADDRESS_16.</p>
Configuration Parameters	

Name	DcmDslProtocolRxAddrType [ECUC_Dcm_00710]		
Parent Container	DcmDslProtocolRx		
Description	<p>Selects the addressing type of the reception channel. Physical addressing is used for 1:1 communication, functional addressing is used for 1:N communication.</p> <p>For details refer to ISO 14229-1.</p>		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	DCM_FUNCTIONAL_TYPE	FUNCTIONAL = 1 to n communication	
	DCM_PHYSICAL_TYPE	PHYSICAL = 1 to 1 communications using physical addressing	
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDslProtocolRxPduld [ECUC_Dcm_00687]				
Parent Container	DcmDslProtocolRx				
Description	Identifier of the PDU that is used for this reception channel.				
Multiplicity	1				
Type	EcucIntegerParamDef (Symbolic Name generated for this parameter)				
Range	0 .. 65535				
Default Value					
Post-Build Variant Value	false				
Value Configuration Class	Pre-compile time	X	All Variants		
	Link time	—			
	Post-build time	—			
Scope / Dependency	scope: ECU				

Name	DcmDslProtocolRxPduRef [ECUC_Dcm_00770]		
Parent Container	DcmDslProtocolRx		
Description	Reference to a Pdu in EcuC that is used for this reception channel.		
Multiplicity	1		
Type	Reference to Pdu		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

No Included Containers

10.2.4.10 DcmDslProtocolTx

SWS Item	[ECUC_Dcm_00711]		
Container Name	DcmDslProtocolTx		
Parent Container	DcmDslMainConnection		
Description	<p>This container contains the configuration parameters of a transmission channel in a diagnostic connection.</p> <p>The PDU referenced by this transmission channel can produce meta data items of type TARGET_ADDRESS_16 and SOURCE_ADDRESS_16.</p>		
Configuration Parameters			

Name	DcmDslTxConfirmationPduld [ECUC_Dcm_00864]		
Parent Container	DcmDslProtocolTx		
Description	Identifier of the PDU that is used by the lower level module for transmission confirmation of responses on this channel.		
Multiplicity	1		
Type	EcucIntegerParamDef (Symbolic Name generated for this parameter)		
Range	0 .. 65535		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDslProtocolTxPduRef [ECUC_Dcm_00772]		
Parent Container	DcmDslProtocolTx		
Description	Reference to a Pdu in EcuC that is used for this transmission channel.		
Multiplicity	1		
Type	Reference to Pdu		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

No Included Containers

10.2.4.11 DcmDslPeriodicTransmission

SWS Item	[ECUC_Dcm_00741]		
Container Name	DcmDslPeriodicTransmission		
Parent Container	DcmDslConnection		
Description	This container contains the configuration of a periodic transmission connection.		
Configuration Parameters			

Included Containers

Container Name	Multiplicity	Scope / Dependency
DcmDslPeriodicConnection	0..255	<p>This container contains the configuration of a transmission channel for a periodic transmission connection.</p> <p>The PDU referenced by this transmission channel can produce meta data items of type TARGET_ADDRESS_16 and SOURCE_ADDRESS_16.</p>

Figure 10.14: DcmDslPeriodicTransmission configuration overview

10.2.4.12 DcmDslPeriodicConnection

SWS Item	[ECUC_Dcm_00897]
Container Name	DcmDslPeriodicConnection
Parent Container	DcmDslPeriodicTransmission
Description	<p>This container contains the configuration of a transmission channel for a periodic transmission connection.</p> <p>The PDU referenced by this transmission channel can produce meta data items of type TARGET_ADDRESS_16 and SOURCE_ADDRESS_16.</p> <p>Attributes: requiresIndex=true</p>
Configuration Parameters	

Name	DcmDslPeriodicTxConfirmationPduld [ECUC_Dcm_00862]
Parent Container	DcmDslPeriodicConnection
Description	Identifier of the PDU that is used by the lower level module for transmission confirmation of responses on this channel.
Multiplicity	1
Type	EcuIntegerParamDef (Symbolic Name generated for this parameter)
Range	0 .. 65535
Default Value	
Post-Build Variant Value	false

Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDslPeriodicTxPduRef [ECUC_Dcm_00742]		
Parent Container	DcmDslPeriodicConnection		
Description	Reference to a Pdu in EcuC that is used for this periodic transmission channel.		
Multiplicity	1		
Type	Reference to Pdu		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

No Included Containers

10.2.4.13 DcmDslResponseOnEvent

SWS Item	[ECUC_Dcm_00744]		
Container Name	DcmDslResponseOnEvent		
Parent Container	DcmDslConnection		
Description	<p>This container contains the configuration of a ResponseOnEvent connection.</p> <p>The PDU referenced by this transmission channel can produce meta data items of type TARGET_ADDRESS_16 and SOURCE_ADDRESS_16.</p>		
Configuration Parameters			

Name	DcmDslRoeTxConfirmationPduld [ECUC_Dcm_00863]				
Parent Container	DcmDslResponseOnEvent				
Description	Identifier of the PDU that is used by the lower level module for transmission confirmation of responses on this connection.				
Multiplicity	0..1				
Type	EcucIntegerParamDef (Symbolic Name generated for this parameter)				
Range	0 .. 65535				
Default Value					
Post-Build Variant Multiplicity	false				

Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDslRoeTxPduRef [ECUC_Dcm_00743]		
Parent Container	DcmDslResponseOnEvent		
Description	Reference to a Pdu in EcuC that is used for this ResponseOnEvent transmission connection.		
Multiplicity	0..1		
Type	Reference to Pdu		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILATION, VARIANT-POST-BUILD

Figure 10.15: **DcmDslResponseOnEvent** configuration overview

10.2.5 DcmDsp

SWS Item	[ECUC_Dcm_00712]
Container Name	DcmDsp
Parent Container	DcmConfigSet
Description	These parameters apply to Diagnostic Service Processing. There will always be one set of these parameters per Dcm. Please note: Although the multiplicity is set to 0..1. It can be expected that this container exists in any valid DCM configuration.
Configuration Parameters	

Name	DcmDspDataDefaultEndianness [ECUC_Dcm_00987]		
Parent Container	DcmDsp		
Description	Defines the default endianness belonging to a DID, RID or PID if the corresponding data does not define an endianness.		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	BIG_ENDIAN	Most significant byte shall be stored at the lowest address.	
	LITTLE_ENDIAN	Most significant byte shall be stored at the highest address	
	OPAQUE false	Opaque data endianness	
Post-Build Variant Value	Pre-compile time	X	VARIANT-PRE-COMPIL
		X	VARIANT-POST-BUILD
		—	VARIANT-LINK-TIME
Scope / Dependency	scope: local		

Name	DcmDspDDIDcheckPerSourceDID [ECUC_Dcm_00966]		
Parent Container	DcmDsp		
Description	Defines the check for session, security and mode dependencies per source DIDs with a ReadDataByIdentifier (0x22). true: Dcm module shall check the session, security and mode dependencies per source DIDs with a ReadDataByIdentifier (0x22) with DID in the range 0xF200 to 0xF3FF false: Dcm module shall not check the session, security and mode dependencies per source DIDs with a ReadDataByIdentifier (0x22) with DID in the range 0xF200 to 0xF3FF		
Multiplicity	0..1		
Type	EcucBooleanParamDef		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		

Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: local		

Name	DcmDspEnableObdMirror [ECUC_Dcm_01061]		
Parent Container	DcmDsp		
Description	DcmDspEnableObdMirror defines whether a DID inside the OBD range (F400-F4FF) and the OBD InfoType range (F800-F8FF) shall get the DID value as defined for OBD on reception of the UDS Service ReadDataByIdentifier (0x22), or not. It also defines whether a RID inside the OBD range (E000-E0FF) shall handle the RID as defined for OBD on reception of the UDS Service RoutineControl (0x31), or not.		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default Value	false		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspMaxDidToDelete [ECUC_Dcm_00638]		
Parent Container	DcmDsp		
Description	Indicates the maximum allowed DIDs in a single "ReadDataByIdentifier" request.		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	1 .. 65535		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	

Scope / Dependency	scope: ECU
---------------------------	------------

Name	DcmDspMaxPeriodicDidToRead [ECUC_Dcm_00956]		
Parent Container	DcmDsp		
Description	Indicates the maximum allowed periodicDIDs which can be read in a single "ReadDataByPeriodicIdentifier" request.		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	1 .. 65535		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: local		

Name	DcmDspPowerDownTime [ECUC_Dcm_00818]		
Parent Container	DcmDsp		
Description	<p>This parameter indicates to the client the minimum time of the stand-by sequence the server will remain in the power-down sequence.</p> <p>The resolution of this parameter is one second per count.</p> <p>The following values are valid: 00 - FE hex: 0 - 254 s powerDownTime; FF hex: indicates a failure or time not available.</p> <p>This value needs to be defined by the integrator according to the ECU capabilities. This parameter has to be available if the service EcuReset, sub-service enableRapidPowerShutDown is configured.</p>		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	0 .. 255		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	

Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDspAuthentication	0..1	This container contains the configuration for the UDS service Authentication (0x29).
DcmDspClearDTC	0..1	This container contains the configuration for the Clear DTC service.
DcmDspComControl	0..1	Provides the configuration of the CommunicationControl mechanism.
DcmDspCommon Authorization	0..*	This container contains the configuration (parameters) for the common Authorization being equal for several services / sub-services.
DcmDspControlDTC Setting	0..1	Provide the configuration of the ControlDTCSetting mechanism.
DcmDspData	0..*	This container contains the configuration (parameters) of a Data belonging to a DID
DcmDspDataInfo	0..*	This container contains the configuration (parameters) of one Data.
DcmDspDid	0..*	This container contains the configuration (parameters) of the DID.
DcmDspDidInfo	0..*	This container contains the configuration (parameters) of the DID's Info
DcmDspDidRange	0..*	This container defines the DID Range
DcmDspEcuReset	0..1	This container contains the configuration for DcmDspEcuReset service
DcmDspMemory	0..1	This container contains the configuration of the memory access.
DcmDspMemoryTransfer	0..1	This container contains the configuration of the memory transfer.
DcmDspPeriodic Transmission	0..1	This container contains the configuration (parameters) for Periodic Transmission Scheduler.
DcmDspPid	0..*	This container defines the availability of a PID to the DCM.
DcmDspReadDTC Information	0..1	This container contains the configuration for the UDS service ReadDTCInformation (0x19).
DcmDspRequestControl	0..*	This container contains the configuration (parameters) of the "Request control of on-board system, test or component" service (Service \$08). The DCM will request the control using an R-Port requiring a PortInterface RequestControlServices_{Tid}. The R-Port is named RequestControlServices_{Tid} where {Tid} is the name of the container DcmDspRequestControl.
DcmDspRequestFile Transfer	0..1	This container contains the configuration for RequestFileTransfer. This container only exists if RequestFileTransfer is configured.
DcmDspRoe	0..1	Provide the configuration of the ResponseOnEvent mechanism.

DcmDspRoutine	0..*	This container contains the configuration (parameters) for Routines
DcmDspSecurity	1	This container contains the configuration (DSP parameter) for security level configuration (per security level) Description This container contains Rows of DcmDspSecurityRow
DcmDspSession	1	Parent container holding single rows to configure particular sessions
DcmDspVehInfo	0..*	This container contains the configuration (parameters) for one single VehicleInfoType of service \$09

Figure 10.16: DcmDsp configuration overview Part1

Figure 10.17: DcmDsp configuration overview Part2

10.2.5.1 DcmDspReadDTCInformation

SWS Item	[ECUC_Dcm_01147]
Container Name	DcmDspReadDTCInformation
Parent Container	DcmDsp
Description	This container contains the configuration for the UDS service ReadDTCInformation (0x19).
Configuration Parameters	

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDspReadDTCInformationUserDefinedFaultMemory	0..255	This container contains the configuration for user defined fault memories in DcmDspReadDTCInformation.

10.2.5.2 DcmDspReadDTCInformationUserDefinedFaultMemory

SWS Item	[ECUC_Dcm_01148]	
Container Name	DcmDspReadDTCInformationUserDefinedFaultMemory	
Parent Container	DcmDspReadDTCInformation	
Description	This container contains the configuration for user defined fault memories in DcmDspReadDTCInformation.	
Configuration Parameters		

Name	DcmDspReadDTCInformationUserDefinedFaultMemoryId [ECUC_Dcm_01149]				
Parent Container	DcmDspReadDTCInformationUserDefinedFaultMemory				
Description	Identifier used by external tester to identify the User defined event Memory.				
Multiplicity	1				
Type	EcclIntegerParamDef				
Range	0 .. 255				
Default Value					
Post-Build Variant Multiplicity	false				
Post-Build Variant Value	false				
Value Configuration Class	Pre-compile time	X	All Variants		
	Link time	—			
	Post-build time	—			
Scope / Dependency	scope: ECU				

Name	DcmDspReadDTCInformationUserDefinedFaultMemoryRole [ECUC_Dcm_01150]				
Parent Container	DcmDspReadDTCInformationUserDefinedFaultMemory				
Description	Bitfield were each bit represents one dedicated role. A user defined fault memory is granted access if the bit value is 1. If a bit value is 0, it is not allowed for that role.				
Multiplicity	0..1				
Type	EcclIntegerParamDef				
Range	0 .. 4294967295				
Default Value					
Post-Build Variant Multiplicity	true				
Post-Build Variant Value	true				

Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL
	Link time	X	VARIANT-LINK-TIME
	Post-build time	X	VARIANT-POST-BUILD

	Link time	X	VARIANT-LINK-TIME
	Post-build time	X	VARIANT-POST-BUILD
Scope / Dependency	scope: ECU		

No Included Containers

10.2.5.3 DcmDspAuthentication

SWS Item	[ECUC_Dcm_01151]
Container Name	DcmDspAuthentication
Parent Container	DcmDsp
Description	This container contains the configuration for the UDS service Authentication (0x29).
Configuration Parameters	

Name	DcmDspAuthenticationDeauthenticatedRole [ECUC_Dcm_01153]		
Parent Container	DcmDspAuthentication		
Description	Role used for service authentication verification in the deauthenticated state.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	1 .. 4294967295		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	-	
	Post-build time	-	
Scope / Dependency	scope: ECU		

Name	DcmDspAuthenticationDefaultSessionTimeOut [ECUC_Dcm_01161]		
Parent Container	DcmDspAuthentication		
Description	Defines the number of seconds after which the Dcm makes a transition to deauthenticated state, in case of no active communication.		
Multiplicity	0..1		
Type	EcucFloatParamDef		
Range	[0 .. INF[

Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspAuthenticationGeneralNRC [ECUC_Dcm_01159]		
Parent Container	DcmDspAuthentication		
Description	Defines the NRC that shall be send as replacement of all ISO 14229-1 defined NRCs in case of invalid certificate or content.		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	0 .. 255		
Default Value	false		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspAuthenticationRoleSize [ECUC_Dcm_01152]		
Parent Container	DcmDspAuthentication		
Description	Defines the size in bytes for the role element within a certificate.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	1 .. 4		
Default Value	false		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspAuthenticationWhiteListDIDMaxSize [ECUC_Dcm_01155]		
Parent Container	DcmDspAuthentication		
Description	Defines the maximum size in bytes for the white list element within a certificate.		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	1 .. 255		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspAuthenticationWhiteListMemorySelectionMaxSize [ECUC_Dcm_01157]		
Parent Container	DcmDspAuthentication		
Description	Defines the maximum size in bytes for the white list element within a certificate.		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	1 .. 255		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false

	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspAuthenticationWhiteListRIDMaxSize [ECUC_Dcm_01156]		
Parent Container	DcmDspAuthentication		
Description	Defines the maximum size in bytes for the white list element within a certificate.		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	1 .. 255		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		

Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspAuthenticationWhiteListServicesMaxSize [ECUC_Dcm_01154]		
Parent Container	DcmDspAuthentication		
Description	Defines the maximum size in bytes for the white list element within a certificate.		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	1 .. 255		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspAuthenticationGeneralNRCModeRuleRef [ECUC_Dcm_01158]		
Parent Container	DcmDspAuthentication		
Description	Mode rule that defines if the general NRC shall be send for all failures due to invalid certificate or content.		
Multiplicity	0..1		
Type	Reference to DcmModeRule		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspAuthenticationPersistStateModeRuleRef [ECUC_Dcm_01160]		
Parent Container	DcmDspAuthentication		
Description	References a mode rule that defines if the authentication state shall be persisted in non-volatile memory.		
Multiplicity	0..1		
Type	Reference to DcmModeRule		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false

Included Containers			
Container Name	Multiplicity	Scope / Dependency	
DcmDspAuthenticationConnection	0..*	This container contains the authentication configuration use for a dsl connection.	

10.2.5.4 DcmDspAuthenticationConnection

SWS Item	[ECUC_Dcm_01162]		
Container Name	DcmDspAuthenticationConnection		
Parent Container	DcmDspAuthentication		
Description	This container contains the authentication configuration use for a dsl connection.		
Configuration Parameters			

Name	DcmDspAuthenticationEcuChallengeLength [ECUC_Dcm_01186]				
Parent Container	DcmDspAuthenticationConnection				
Description	Length in byte of the ECU challenge				
Multiplicity	1				
Type	EcucIntegerParamDef				
Range	1 .. 65535				
Default Value					
Post-Build Variant Value	false				
Value Configuration Class	Pre-compile time	X	All Variants		
	Link time	—			
	Post-build time	—			
Scope / Dependency					

Name	DcmDspAuthenticationCertificatePublicKeyStoreJobRef [ECUC_Dcm_01176]		
Parent Container	DcmDspAuthenticationConnection		
Description	Reference to a CsmJob used to store the public key within the Csm.		
Multiplicity	1		
Type	Symbolic name reference to CsmJob		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspAuthenticationClientChallengeSignJobRef [ECUC_Dcm_01174]		
Parent Container	DcmDspAuthenticationConnection		
Description	Reference to a job used to sign the client challenge.		
Multiplicity	1		
Type	Symbolic name reference to CsmJob		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants

10.2.5.5 Communication Control

10.2.5.5.1 DcmDspComControl

SWS Item	[ECUC_Dcm_00900]		
Container Name	DcmDspComControl		
Parent Container	DcmDsp		
Description	Provides the configuration of the CommunicationControl mechanism.		
Configuration Parameters			

Included Containers			
Container Name	Multiplicity	Scope / Dependency	
DcmDspComControlAllChannel	0..*	Collection of ComM channels which shall be controlled if all networks are addressed.	
DcmDspComControlSetting	0..1	Provide the configuration of the Communication control.	
DcmDspComControlSpecificChannel	0..*	Assigns subnet number to ComM channel which will be controlled.	
DcmDspComControlSubNode	0..65535	This container gives information about the node identification number and the ComM channel used to address a sub-network.	

Figure 10.18: DcmDspComControl configuration overview

10.2.5.5.2 DcmDspComControlAllChannel

SWS Item	[ECUC_Dcm_00901]
Container Name	DcmDspComControlAllChannel
Parent Container	DcmDspComControl
Description	Collection of ComM channels which shall be controlled if all networks are addressed.

Configuration Parameters

Name	DcmDspComControlAllChannelUsed [ECUC_Dcm_01045]		
Parent Container	DcmDspComControlAllChannel		
Description	Allow to activate or deactivate the usage of a ComM channel collection to be controlled, for multi purpose ECUs true = ComM channel collection used false = ComM channel collection not used		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default Value	true		
Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL
	Link time	X	VARIANT-LINK-TIME
	Post-build time	X	VARIANT-POST-BUILD
Scope / Dependency	scope: local		

Name	DcmDspAllComMChannelRef [ECUC_Dcm_00902]		
Parent Container	DcmDspComControlAllChannel		
Description	Reference to ComM channel.		
Multiplicity	1		
Type	Symbolic name reference to ComMChannel		
Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL
	Link time	X	VARIANT-LINK-TIME
	Post-build time	X	VARIANT-POST-BUILD
Scope / Dependency	scope: ECU		

No Included Containers
10.2.5.5.3 DcmDspComControlSetting

SWS Item	[ECUC_Dcm_00943]
Container Name	DcmDspComControlSetting
Parent Container	DcmDspComControl
Description	Provide the configuration of the Communication control.
Configuration Parameters	

Name	DcmDspComControlCommunicationReEnableModeRuleRef [ECUC_Dcm_00944]		
Parent Container	DcmDspComControlSetting		
Description	Reference to DcmModeRule Mode rule which controls re-enabling of communication by DCM. [ref. SWS_Dcm_00753]		
Multiplicity	0..1		
Type	Reference to DcmModeRule		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

No Included Containers

10.2.5.5.4 DcmDspComControlSpecificChannel

SWS Item	[ECUC_Dcm_00903]		
Container Name	DcmDspComControlSpecificChannel		
Parent Container	DcmDspComControl		
Description	Assigns subnet number to ComM channel which will be controlled.		
Configuration Parameters			

Name	DcmDspComControlSpecificChannelUsed [ECUC_Dcm_01046]		
Parent Container	DcmDspComControlSpecificChannel		
Description	Allow to activate or deactivate the usage of a Subnet assigned to the ComM channel which will be controlled, for multi purpose ECUs. true = Subnet used false = Subnet not used		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default Value	true		
Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe
	Link time	X	VARIANT-LINK-TIME
	Post-build time	X	VARIANT-POST-BUILD
Scope / Dependency	scope: local		

Name	DcmDspSubnetNumber [ECUC_Dcm_00905]		
Parent Container	DcmDspComControlSpecificChannel		
Description	Subnet Number which controls the specific ComMChannel.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	1 .. 14		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspSpecificComMChannelRef [ECUC_Dcm_00904]		
Parent Container	DcmDspComControlSpecificChannel		
Description	Reference to ComM channel.		
Multiplicity	1		
Type	Symbolic name reference to ComMChannel		
Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL
	Link time	X	VARIANT-LINK-TIME
	Post-build time	X	VARIANT-POST-BUILD
Scope / Dependency	scope: ECU		

No Included Containers

10.2.5.5.5 DcmDspComControlSubNode

SWS Item	[ECUC_Dcm_01033]
Container Name	DcmDspComControlSubNode
Parent Container	DcmDspComControl
Description	This container gives information about the node identification number and the ComM channel used to address a sub-network.
Configuration Parameters	

Name	DcmDspComControlSubNodId [ECUC_Dcm_01031]		
Parent Container	DcmDspComControlSubNode		
Description	The node identification number DcmDspComControlSubNodId is addressed by the CommunicationControl (0x28) request.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	1 .. 65535		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspComControlSubNodeUsed [ECUC_Dcm_01032]		
Parent Container	DcmDspComControlSubNode		
Description	This parameter determines if a node control function is available or not.		
Multiplicity	1		
Type	EcucBooleanParamDef		
	true		
Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL
	Link time	X	VARIANT-LINK-TIME
	Post-build time	X	VARIANT-POST-BUILD
Scope / Dependency	scope: local		

Name	DcmDspComControlSubNodeComMChannelRef [ECUC_Dcm_01030]		
Parent Container	DcmDspComControlSubNode		
Description	This parameter references a ComM channel where this node is connected to.		
Multiplicity	1		
Type	Symbolic name reference to ComMChannel		
Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL
	Link time	X	VARIANT-LINK-TIME
	Post-build time	X	VARIANT-POST-BUILD
Scope / Dependency	scope: ECU		

No Included Containers

10.2.5.6 DcmDspCommonAuthorization

SWS Item	[ECUC_Dcm_01025]
Container Name	DcmDspCommonAuthorization
Parent Container	DcmDsp
Description	This container contains the configuration (parameters) for the common Authorization being equal for several services / sub-services.
Configuration Parameters	

Name	DcmDspCommonAuthorizationModeRuleRef [ECUC_Dcm_01028]		
Parent Container	DcmDspCommonAuthorization		
Description	Reference to DcmModeRule Mode rule which controls this service/ sub-service. If there is no reference, no check of the mode rule shall be done.		
Multiplicity	0..1		
Type	Reference to DcmModeRule		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	

Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

Name	DcmDspCommonAuthorizationSecurityLevelRef [ECUC_Dcm_01026]		
Parent Container	DcmDspCommonAuthorization		
Description	Reference to DcmDspSecurityRow Security levels allowed to control this service/ sub-service. If there is no reference, no check of security level shall be done.		
Multiplicity	0..*		
Type	Reference to DcmDspSecurityRow		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

Name	DcmDspCommonAuthorizationSessionRef [ECUC_Dcm_01027]		
Parent Container	DcmDspCommonAuthorization		
Description	Reference to DcmDspSessionRow Sessions allowed to control this service/ sub-service. If there is no reference, no check of session level shall be done.		
Multiplicity	0..*		
Type	Reference to DcmDspSessionRow		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

No Included Containers

10.2.5.7 DIDs

10.2.5.7.1 DcmDspDid

SWS Item	[ECUC_Dcm_00601]
Container Name	DcmDspDid
Parent Container	DcmDsp
Description	This container contains the configuration (parameters) of the DID.
Configuration Parameters	

Name	DcmDspDidIdentifier [ECUC_Dcm_00602]	
Parent Container	DcmDspDid	
Description	2 byte Identifier of the DID Within each DcmConfigSet all DcmDspDidIdentifier values shall be unique.	
Multiplicity	1	
Type	EcucIntegerParamDef	
Range	0 .. 65535	
Default Value		
Post-Build Variant Value	false	

Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

Name	DcmDspDidSize [ECUC_Dcm_01099]		
Parent Container	DcmDspDid		
Description	Length of a DID in byte(s).		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	0 .. 65535		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

Name	DcmDspDidUsed [ECUC_Dcm_00805]		
Parent Container	DcmDspDid		
Description	Allow to activate or deactivate the usage of a DID, for multi purpose ECUs true = DID available false = DID not available		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default Value			
Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL
	Link time	X	VARIANT-LINK-TIME
	Post-build time	X	VARIANT-POST-BUILD
Scope / Dependency	scope: ECU		

Name	DcmDspDidUsePort [ECUC_Dcm_01122]		
Parent Container	DcmDspDid		
Description	Selects application interface type for DID data elements between a single operation for all data elements or data element specific operations.		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	USE_ATOMIC_BNDM	The DID shall be read/written from/to BndM.	

Default Value	USE_ATOMIC_NV_DATA_INTERFACE	A single sender receiver interface with NvData-Ports is used for all data elements of this DID.		
	USE_ATOMIC_SENDER_RECEIVER_INTERFACE	A single sender receiver interface is used to access all data elements of this DID. The sender receiver interface is typed with IsService=false.		
	USE_ATOMIC_SENDER_RECEIVER_INTERFACE_AS_SERVICE	A single sender receiver interface is used to access all data elements of this DID. The sender receiver interface is typed with IsService=true.		
	USE_DATA_ELEMENT_SPECIFIC_INTERFACES	The data elements of this DID are collected by using the data element specific interfaces defined by DcmDspDataUsePort.		
	USE_DATA_ELEMENT_SPECIFIC_INTERFACES			
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time	X	All Variants	
	Link time	—		
	Post-build time	—		
Scope / Dependency				

Name	DcmDspDidBndMBlockIdRef [ECUC_Dcm_01185]		
Parent Container	DcmDspDid		
Description	Associate this DID with a BndM blockId.		
Multiplicity	0..1		
Type	Symbolic name reference to BndMBlockDescriptor		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU dependency: DcmDspDidUsePort == USE_ATOMIC_BNDM		

Name	DcmDspDidInfoRef [ECUC_Dcm_00604]		
Parent Container	DcmDspDid		
Description	Reference to DcmDspDidInfo containing information on this DID.		
Multiplicity	1		
Type	Reference to DcmDspDidInfo		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspDidRef [ECUC_Dcm_00606]		
Parent Container	DcmDspDid		
Description	Reference to DcmDspDid in case this DID refer to one or serveral other DID's		
	Attributes: requiresIndex=true		
Multiplicity	0..*		
Type	Reference to DcmDspDid		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Included Containers			
Container Name	Multiplicity	Scope / Dependency	
DcmDspDidSignal	0..*	This container defines the reference to 1 DcmDspData container and position relevant for this DID.	
DcmDspDidSupportInfo	0..1	This container defines the support information to declare the usability of the data bytes within the DIDs	

Figure 10.21: DcmDspDid configuration overview

10.2.5.7.2 DcmDspDidInfo

SWS Item [ECUC_Dcm_00607]

Container Name	DcmDspDidInfo
Parent Container	DcmDsp
Description	This container contains the configuration (parameters) of the DID's Info
Configuration Parameters	

Name	DcmDspDDIDMaxElements [ECUC_Dcm_00970]		
Parent Container	DcmDspDidInfo		
Description	Maximum number of source elements of a DDID.		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	1 .. 255		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: local		

Name	DcmDspDidDynamicallyDefined [ECUC_Dcm_00612]		
Parent Container	DcmDspDidInfo		
Description	Indicates if this DID can be dynamically defined true = DID can be dynamically defined false = DID can not be dynamically defined		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDspDidControl	0..1	This container contains the configuration (parameters) of the DID control.
DcmDspDidRead	0..1	This container contains the configuration (parameters) of the DID read.

DcmDspDidWrite	0..1	This container contains the configuration (parameters) of the DID write.

Figure 10.22: DcmDspDidInfo configuration overview

10.2.5.7.3 DcmDspDidRead

SWS Item	[ECUC_Dcm_00613]
Container Name	DcmDspDidRead
Parent Container	DcmDspDidInfo
Description	This container contains the configuration (parameters) of the DID read.
Configuration Parameters	

Name	DcmDspDidReadRole [ECUC_Dcm_01141]		
Parent Container	DcmDspDidRead		
Description	<p>Bitfield where each bit represents one dedicated role. A DID is granted read access if the bit value is 1. If a bit value is 0, the DID is not allowed to be read for that role.</p> <p>Reading DIDs is possible by different UDS services. This setting applies to all possible DID read operations.</p>		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	0 .. 4294967295		
Default Value			
Post-Build Variant Multiplicity	true		
Post-Build Variant Value	true

Figure 10.23: DcmDspDidRead configuration overview

10.2.5.7.4 DcmDspDidSignal

SWS Item	[ECUC_Dcm_00813]
Container Name	DcmDspDidSignal
Parent Container	DcmDspDid
Description	This container defines the reference to 1 DcmDspData container and position relevant for this DID.
Configuration Parameters	

Name	DcmDspDidByteOffset [ECUC_Dcm_01105]
Parent Container	DcmDspDidSignal
Description	Defines the absolute byte offset of the data defined by DcmDspDidDataRef reference to DcmDspData container in the DID.
Multiplicity	1
Type	EcucIntegerParamDef
Range	0 .. 65535
Default Value	
Post-Build Variant Value	false

Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

Name	DcmDspDidDataRef [ECUC_Dcm_00808]		
Parent Container	DcmDspDidSignal		
Description	Reference to 1 DcmDspData container relevant for this DID.		
Multiplicity	1		
Type	Reference to DcmDspData		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

No Included Containers

10.2.5.7.5 DcmDspDidSupportInfo

SWS Item	[ECUC_Dcm_01102]		
Container Name	DcmDspDidSupportInfo		
Parent Container	DcmDspDid		
Description	This container defines the support information to declare the usability of the data bytes within the DIDs		
Configuration Parameters			

Name	DcmDspDidSupportInfoLen [ECUC_Dcm_01103]		
Parent Container	DcmDspDidSupportInfo		
Description	Length of the support information in bytes.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 255		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

Name	DcmDspDidSupportInfoPos [ECUC_Dcm_01100]		
Parent Container	DcmDspDidSupportInfo		
Description	Length of the support information in bytes.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 255		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

No Included Containers

10.2.5.7.6 DcmDspDidRange

SWS Item	[ECUC_Dcm_00937]		
Container Name	DcmDspDidRange		
Parent Container	DcmDsp		
Description	This container defines the DID Range		
Configuration Parameters			

Name	DcmDspDidRangeHasGaps [ECUC_Dcm_00941]		
Parent Container	DcmDspDidRange		
Description	Parameter specifying if there are gaps in the DID range (parameter set to TRUE) or not (parameter set to FALSE)		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

Name	DcmDspDidRangeIdentifierLowerLimit [ECUC_Dcm_00938]		
Parent Container	DcmDspDidRange		
Description	Lower limit of DID range.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 65535		

Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspDidRangeIdentifierUpperLimit [ECUC_Dcm_00939]		
Parent Container	DcmDspDidRange		
Description	Upper limit of DID range.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range Default Value	0 .. 65535		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspDidRangeIsDidAvailableFnc [ECUC_Dcm_00946]		
Parent Container	DcmDspDidRange		
Description	Function name to request from application if a specific DID is available within the range or not. Only relevant if DcmDspDidRangeUsePort is set to false. This parameter is related to the interface Xxx_IsDidAvailable.		
Multiplicity	0..1		
Type Default Value	EcucFunctionNameDef		
Regular Expression			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspDidRangeMaxDataLength [ECUC_Dcm_00940]		
Parent Container	DcmDspDidRange		
Description	Maximum data length in bytes		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 65535		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

Name	DcmDspDidRangeReadDataLengthFnc [ECUC_Dcm_01067]		
Parent Container	DcmDspDidRange		
Description	<p>Function name to request from application the length of the data of a range DID.</p> <p>Only relevant if DcmDspDidRangeUsePort is set to false. This parameter is related to the interface Xxx_ReadDidRangeDataLength.</p>		
Multiplicity	0..1		
Type	EcucFunctionNameDef		
Default Value			
Regular Expression			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	-	
	Post-build time	-	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	-	
	Post-build time	-	
Scope / Dependency	scope: ECU		

Name	DcmDspDidRangeReadDidFnc [ECUC_Dcm_00947]		
Parent Container	DcmDspDidRange		
Description	Function name to request from application the data range value of a DID.(ReadData-function). Only relevant if DcmDspDidRangeUsePort is set to false. This parameter is related to the interface Xxx_ReadDidData.		
Multiplicity	0..1		
Type	EcucFunctionNameDef		
Default Value			
Regular Expression			

Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspDidRangeUsePort [ECUC_Dcm_00945]		
Parent Container	DcmDspDidRange		
Description	When the parameter DcmDspDidRangeUsePort is set to true the DCM will access the Data using an R-Port requiring a PortInterface DataServices_DIDRange. In that case, DcmDspDidRangesDidAvailableFnc, DcmDspDidRangeReadDidFnc and DcmDspDidRangeWriteDidFnc are ignored and the RTE APIs are used. When the parameter DcmDspDidRangeUsePort is false, the DCM calls the functions defined in DcmDspDidRangesDidAvailableFnc, DcmDspDidRangeReadDidFnc and DcmDspDidRangeWriteDidFnc.		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspDidRangeWriteDidFnc [ECUC_Dcm_00948]		
Parent Container	DcmDspDidRange		
Description	Function name to request application to write the data range value of a DID.(WriteData-function). Only relevant if DcmDspDidRangeUsePort is set to false. This parameter is related to the interface Xxx_WriteDidData.		
Multiplicity	0..1		
Type	EcucFunctionNameDef		
Default Value			
Regular Expression			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		

Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—

	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspDidRangeInfoRef [ECUC_Dcm_00950]		
Parent Container	DcmDspDidRange		
Description	Reference to DcmDspDidInfo containing information on this DID Range.		
Multiplicity	1		
Type	Reference to DcmDspDidInfo		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Figure 10.24: DcmDspDidRange configuration overview

10.2.5.7.7 DcmDspDidWrite

SWS Item	[ECUC_Dcm_00616]
Container Name	DcmDspDidWrite
Parent Container	DcmDspDidInfo
Description	This container contains the configuration (parameters) of the DID write.
Configuration Parameters	

Name	DcmDspDidWriteRole [ECUC_Dcm_01142]		
Parent Container	DcmDspDidWrite		
Description	Bitfield were each bit represents one dedicated role. A DID is granted write access if the bit value is 1. If a bit value is 0, the DID is not allowed to be written for that role.		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	0 .. 4294967295		
Default Value			
Post-Build Variant Multiplicity	true		
Post-Build Variant Value	true		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL
	Link time	X	VARIANT-LINK-TIME
	Post-build time	X	VARIANT-POST-BUILD
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL
	Link time	X	VARIANT-LINK-TIME
	Post-build time	X	VARIANT-POST-BUILD
Scope / Dependency	scope: ECU		

Name	DcmDspDidWriteModeRuleRef [ECUC_Dcm_00922]		
Parent Container	DcmDspDidWrite		
Description	Reference to DcmModeRule Mode rule which controls to write this DID. If there is no reference, no check of the mode rule shall be done.		
Multiplicity	0..1		
Type	Reference to DcmModeRule		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false

10.2.5.8 DcmDspControlDTCSetting

SWS Item	[ECUC_Dcm_00935]
Container Name	DcmDspControlDTCSetting
Parent Container	DcmDsp
Description	Provide the configuration of the ControlDTCSetting mechanism.
Configuration Parameters	

Name	DcmSupportDTCSettingControlOptionRecord [ECUC_Dcm_00965]
Parent Container	DcmDspControlDTCSetting
Description	This configuration switch defines if the DTCSettingControlOptionRecord is in general supported in the request message or not.
Multiplicity	0..1
Type	EcucBooleanParamDef
Default Value	false
Post-Build Variant Multiplicity	false
Post-Build Variant Value	false

Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspControlDTCSettingReEnableModeRuleRef [ECUC_Dcm_00936]		
Parent Container	DcmDspControlDTCSetting		
Description	Reference to DcmModeRule Mode rule which controls re-enabling of controlDTCsetting by DCM. The DCM module shall execute a ControlDTCSetting.Off (call Dem_EnableDTCSetting()) in case that the referenced mode rule is not fulfilled anymore.		
Multiplicity	0..1		
Type	Reference to DcmModeRule		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME

10.2.5.9 Data elements

10.2.5.9.1 DcmDspData

SWS Item	[ECUC_Dcm_00869]
Container Name	DcmDspData
Parent Container	DcmDsp
Description	This container contains the configuration (parameters) of a Data belonging to a DID
Configuration Parameters	

Name	DcmDspDataByteSize [ECUC_Dcm_01106]		
Parent Container	DcmDspData		
Description	Defines the array length in bytes or the the maximum array length for variable datalengths.		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	0 .. 65535		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-

Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspDataEndianness [ECUC_Dcm_00986]		
Parent Container	DcmDspData		
Description	Defines the endianness of the data belonging to a DID in a diagnostic request or response message.		
Multiplicity	0..1		
Type	EcucEnumerationParamDef		
Range	BIG_ENDIAN	Most significant byte shall be stored at the lowest address.	
	LITTLE_ENDIAN	Most significant byte shall be stored at the highest address.	
	OPAQUE	Opaque data endianness	
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—

	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspDataUsePort [ECUC_Dcm_00713]		
Parent Container	DcmDspData		
Description	Defines which interface shall be used to access the data.		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	USE_BLOCK_ID	The DCM will access the Data using the NVRAM Apis with the BlockId defined in DcmDspDataBlockId	

	USEDATAASYNCHCLIENTSERVER	The DCM will access the Data using an R-Port requiring a asynchronous ClientServerInterface DataServices_{Data}. The R-Port is named DataServices_{Data} where {Data} is the name of the container DcmDspData.
	USEDATAASYNCHCLIENTSERVER_ERROR	The Dcm will access the Data using an R-Port requiring a asynchronous ClientServerInterface DataServices_{Data}. The parameter ErrorCode can be returned to allow the application to trigger a negative response during the operation. The R-Port is named DataServices_{Data} where {Data} is the name of the container DcmDspData.
	USEDATAASYNCHFN	The DCM will access the Data using the functions that are defined in parameters of type EcucFunctionNameDef (but without DcmDspDataReadDataLengthFnc) in the DcmDspData container. DCM_E_PENDING return is allowed. OpStatus is existing as IN parameter.
	USEDATAASYNCHFN_C_ERROR	The DCM will access the Data using the functions that are defined in parameters of type EcucFunctionNameDef (but without DcmDspDataReadDataLengthFnc) in the DcmDspData container. DCM_E_PENDING return is allowed. OpStatus is existing as IN parameter. The parameter ErrorCode can be returned to allow the application to trigger a negative response during the operation.
	USEDATASENDERRECEIVER	The DCM will access the Data using an Port requiring a SenderReceiverInterface (with isService=false) DataServices_{Data}. The Port is namedDataServices_{Data} where {Data} is the name of the container DcmDspData.
	USEDATASENDERRECEIVER_AS_SERVICE	The DCM will access the Data using an service Port requiring a SenderReceiverInterface (with isService=true) DataServices_{Data}. The Port is namedDataServices_{Data} where {Data} is the name of the container DcmDspData.

Post-Build Variant Value	USE_DATA_SYNCH_CLIENT_SERVER	The DCM will access the Data using an R-Port requiring a synchronous ClientServerInterface DataServices_{Data}. The R-Port is named DataServices_{Data} where {Data} is the name of the container DcmDspData.	
	USE_DATA_SYNCH_FNC	The DCM will access the Data using the functions that are defined in parameters of type EcucFunctionNameDef (but without DcmDspDataReadDataLengthFnc) in the DcmDspData container. DCM_E_PENDING return value is not allowed and OpStatus parameter is not existing in the prototype.	
	USE_ECU_SIGNAL	The DCM will access the Data using a direct access to IoHwAb

10.2.5.9.2 DcmDspDiagnosisScaling

SWS Item	[ECUC_Dcm_00993]
Container Name	DcmDspDiagnosisScaling
Parent Container	DcmDspData, DcmDspPidService01
Description	This container contains the configuration (parameters) of an alternative Diagnosis Representation. Out of this the scaling between Diagnosis and ECU internal representation and vice versa can be calculated.
Configuration Parameters	

Container Choices		
Container Name	Multiplicity	Scope / Dependency
DcmDspAlternativeData Interface	0..1	<p>This container contains the configuration (parameters) of an alternative Diagnosis Representation by the means of a VariableDataPrototype in a DataInterface.</p> <p>Additionally a reference to PortInterfaceMapping can be defined which provide already the mapping rules between the VariableDataPrototype in a DataInterface used by the software component (DcmDspExternalSRDataElementClass) and the intended Diagnosis Representation defined by DcmDataElement.</p>
DcmDspAlternativeDataType	0..1	<p>This container contains the configuration (parameters) of an alternative Diagnosis Representation by the means of an ApplicationDataType.</p> <p>Additionally the definition of a text table mapping can be defined for ApplicationDataTypes with a CompuMethod of category TEXTTABLE and SCALE_LINEAR_AND_TEXTTABLE.</p>
DcmDspAlternativeDiagnosticDataElement	0..1	This container contains the configuration (parameters) of an alternative Diagnosis Representation by the means of Diagnostic Extract.

10.2.5.9.3 DcmDspArgumentScaling

SWS Item	[ECUC_Dcm_01062]
Container Name	DcmDspArgumentScaling
Parent Container	DcmDspRequestRoutineResultsInSignal, DcmDspRequestRoutine ResultsOutSignal, DcmDspStartRoutineInSignal, DcmDspStartRoutine OutSignal, DcmDspStopRoutineInSignal, DcmDspStopRoutineOut Signal
Description	This container contains the configuration (arguments) of an alternative Diagnosis Representation. Out of this the scaling between Diagnosis and ECU internal representation and vice versa can be calculated.
Configuration Parameters	

Container Choices		
Container Name	Multiplicity	Scope / Dependency
DcmDspAlternativeArgumentData	0..1	This container contains the configuration (parameters) of an alternative Diagnosis Representation by the means of a ArgumentDataPrototype.
DcmDspAlternativeDataType	0..1	<p>This container contains the configuration (parameters) of an alternative Diagnosis Representation by the means of an ApplicationDataType.</p> <p>Additionally the definition of a text table mapping can be defined for ApplicationDataTypes with a CompuMethod of category TEXTTABLE and SCALE_LINEAR_AND_TEXTTABLE.</p>

DcmDspAlternativeDiagnosticDataElement	0..1	This container contains the configuration (parameters) of an alternative Diagnosis Representation by the means of Diagnostic Extract.

Name	DcmDspDidControlMaskSize [ECUC_Dcm_01060]				
Parent Container	DcmDspDidControl				
Description	The value defines the size of the controlEnableMaskRecord in bytes.				
Multiplicity	0..1				
Type	EcucIntegerParamDef				
Range	1 .. 4294967294				
Default Value					
Post-Build Variant Value	false				
Value Configuration Class	Pre-compile time	X	All Variants		
	Link time	—			
	Post-build time	—			
Scope / Dependency	scope: ECU				

Name	DcmDspDidControlRole [ECUC_Dcm_01143]				
Parent Container	DcmDspDidControl				
Description	Bitfield were each bit represents one dedicated role. A DID is granted IOcontrol access if the bit value is 1. If a bit value is 0, the DID is not allowed to be controlled for that role.				
Multiplicity	0..1				
Type	EcucIntegerParamDef				
Range	0 .. 4294967295				
Default Value					
Post-Build Variant Multiplicity	true				

Post-Build Variant Value	true		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL
	Link time	X	VARIANT-LINK-TIME

Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL
	Link time	X	VARIANT-LINK-TIME
	Post-build time	X	VARIANT-POST-BUILD
Scope / Dependency	scope: ECU		

Name	DcmDspDidFreezeCurrentState [ECUC_Dcm_00624]		
Parent Container	DcmDspDidControl		
Description	This indicates the presence of "FreezeCurrentState".		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspDidResetToDefault [ECUC_Dcm_00623]		
Parent Container	DcmDspDidControl		
Description	This indicates the presence of "ResetToDefault".		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspDidShortTermAdjustment [ECUC_Dcm_00625]		
Parent Container	DcmDspDidControl		
Description	This indicates the presence of "ShortTermAdjustment".		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default Value			
Post-Build Variant Value	false		

Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspDidControlModeRuleRef [ECUC_Dcm_00923]		
Parent Container	DcmDspDidControl		
Description	Reference to DcmModeRule Mode rule which controls this DID. If there is no reference, no check of the mode rule shall be done.		
Multiplicity	0..1		
Type	Reference to DcmModeRule		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD

Included Containers			
Container Name	Multiplicity	Scope / Dependency	
DcmDspDidControl EnableMask	0..32	The shortname of the container value defines the symbol of the controlMask.	

Figure 10.33: DcmDspDidControl configuration overview

10.2.5.11 DcmDspDidControlEnableMask

SWS Item	[ECUC_Dcm_01057]
Container Name	DcmDspDidControlEnableMask
Parent Container	DcmDspDidControl
Description	The shortname of the container value defines the symbol of the controlMask.
Configuration Parameters	

Name	DcmDspDidControlMaskBitPosition [ECUC_Dcm_01058]		
Parent Container	DcmDspDidControlEnableMask		
Description	Defines the position of the bit in the controlMask starting. The counting order is from the most significant bit (MSB first) to least significant bit. A value of 0 identifies the most significant bit in the MSB of the control enable mask. A value of 0 represents also the first controlState parameter. The bit endianness is identical to the controlMask in UDS. The number of possible and available bits is given by DcmDspDidControlMaskSize.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 31		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU

10.2.5.12 Ecu Reset

10.2.5.12.1 DcmDspEcuReset

SWS Item	[ECUC_Dcm_01111]
Container Name	DcmDspEcuReset
Parent Container	DcmDsp
Description	This container contains the configuration for DcmDspEcuReset service
Configuration Parameters	

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDspEcuResetRow	1..*	This container contains the configuration for each DcmDspEcuReset subservice.

Figure 10.34: DcmDspEcuReset configuration overview

10.2.5.12.2 DcmDspEcuResetRow

SWS Item	[ECUC_Dcm_01112]
Container Name	DcmDspEcuResetRow
Parent Container	DcmDspEcuReset
Description	This container contains the configuration for each DcmDspEcuReset subservice.
Configuration Parameters	

Name	DcmDspEcuResetId [ECUC_Dcm_01113]
Parent Container	DcmDspEcuResetRow
Description	Defines the subfunction ID
Multiplicity	1
Type	EcuParamConfContainerDef
Range	0 .. 127
Default Value	
Post-Build Variant Multiplicity	false

Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmResponseToEcuReset [ECUC_Dcm_01039]		
Parent Container	DcmDspEcuResetRow		
Description	Defines the answer to EcuReset service should come: Before or after the reset.		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	AFTER_RESET	Answer to EcuReset service should come after the reset.	
	BEFORE_RESET	Answer to EcuReset service should come before the reset.	
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU

10.2.5.13 Memory

10.2.5.13.1 DcmDspMemory

SWS Item	[ECUC_Dcm_00784]		
Container Name	DcmDspMemory		
Parent Container	DcmDsp		
Description	This container contains the configuration of the memory access.		
Configuration Parameters			

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDspAddressAndLengthFormatIdentifier	0..1	This container contains the configuration of the supported AddressAndLengthFormatIdentifiers for memory access.
DcmDspMemoryIdInfo	1..*	Provides the value of memory identifier used to select the desired memory device This container contains the configuration of the memory access requested through diagnostic services : ReadMemoryByAddress, WriteMemoryByAddress, and DynamicallyDefineDataIdentifier

10.2.5.13.2 DcmDspMemoryTransfer

SWS Item	[ECUC_Dcm_01132]
Container Name	DcmDspMemoryTransfer
Parent Container	DcmDsp
Description	This container contains the configuration of the memory transfer.
Configuration Parameters	

Name	DcmDspMemoryTransferFnc [ECUC_Dcm_01134]		
Parent Container	DcmDspMemoryTransfer		
Description	Function name for memory transfer services. Only relevant if DcmDspMemoryTransferUsePort is set to false.		
Multiplicity	0..1		
Type	EcucFunctionNameDef		
Default Value			
Regular Expression			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspMemoryTransferUsePort [ECUC_Dcm_01133]		
Parent Container	DcmDspMemoryTransfer		
Description	If this parameter is set to true, the Dcm uses a port requiring a PortInterface UploadDownload. If the parameter is false, the DCM uses the according C-API callouts.		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default Value	false		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDspAddressAndLengthFormatIdentifier	0..1	This container contains the configuration of the supported AddressAndLengthFormatIdentifiers for memory access.
DcmDspMemoryTransferIdInfo	1..*	Provides the value of memory identifier used to select the desired memory device This container contains the configuration of the memory access requested through diagnostic services : RequestDownload, RequestUpload, TransferData, RequestTransferExit

10.2.5.13.3 DcmDspAddressAndLengthFormatIdentifier

SWS Item	[ECUC_Dcm_00963]	
Container Name	DcmDspAddressAndLengthFormatIdentifier	
Parent Container	DcmDspMemory , DcmDspMemoryTransfer	
Description	This container contains the configuration of the supported AddressAndLengthFormatIdentifiers for memory access.	
Configuration Parameters		

Name	DcmDspSupportedAddressAndLengthFormatIdentifier [ECUC_Dcm_00964]	
Parent Container	DcmDspAddressAndLengthFormatIdentifier	
Description	This parameter defines the supported AddressAndLengthFormatIdentifier of the request message.	
Multiplicity	1..*	
Type	EcucIntegerParamDef	
Range	0 .. 255	
Default Value	false	
Post-Build Variant Multiplicity	false	

Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD

Container Name	DcmDspWriteMemoryRangeInfo
Parent Container	DcmDspMemoryIdInfo
Description	Provides the range of memory address allowed for writing.
Configuration Parameters	

Name	DcmDspWriteMemoryRangeHigh [ECUC_Dcm_00791]		
Parent Container	DcmDspWriteMemoryRangeInfo		
Description	High memory address of a range allowed for writing.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 4294967294		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

Name	DcmDspWriteMemoryRangeLow [ECUC_Dcm_00790]		
Parent Container	DcmDspWriteMemoryRangeInfo		
Description	Low memory address of a range allowed for writing		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 4294967294		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

Name	DcmDspWriteMemoryRangeModeRuleRef [ECUC_Dcm_00916]		
Parent Container	DcmDspWriteMemoryRangeInfo		
Description	Reference to DcmModeRule		
	Mode rule which controls write access on this memory address. If there is no reference, no check of the mode rule shall be done.		
Multiplicity	0..1		
Type	Reference to DcmModeRule		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		

Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspWriteMemoryRangeSecurityLevelRef [ECUC_Dcm_00793]		
Parent Container	DcmDspWriteMemoryRangeInfo		
Description	Link to the Security Access Levels needed for write access on this memory address. If there is no reference, no check of security level shall be done.		
Multiplicity	0..*		
Type	Reference to DcmDspSecurityRow		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspWriteMemoryRangeSessionLevelRef [ECUC_Dcm_01087]		
Parent Container	DcmDspWriteMemoryRangeInfo		
Description	Link to the session level needed for access to this memory address range. If there is no reference, no check of session level shall be done.		
Multiplicity	0..*		
Type	Reference to DcmDspSessionRow		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	

Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL E, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

No Included Containers

10.2.5.14 PIDs

10.2.5.14.1 DcmDspPid

SWS Item	[ECUC_Dcm_00626]
Container Name	DcmDspPid
Parent Container	DcmDsp
Description	This container defines the availability of a PID to the DCM.
Configuration Parameters	

Name	DcmDspPidIdentifier [ECUC_Dcm_00627]		
Parent Container	DcmDspPid		
Description	1 byte Identifier of the PID Within each DcmConfigSet all DcmDspPidIdentifier values shall be unique.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 255		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

Name	DcmDspPidService [ECUC_Dcm_00893]		
Parent Container	DcmDspPid		
Description	Indicates if a PID is used with service \$01 and/or \$02		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	DCM_SERVICE_01	A PID is used with service \$01 only.	
	DCM_SERVICE_01_02	A PID is used with service \$01 and \$02. Allowed with a PID configuration containing data elements on byte basis.	
	DCM_SERVICE_02	A PID is used with service \$02 only. Allowed with a PID configuration containing data elements on byte basis.	
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

Name	DcmDspPidSize [ECUC_Dcm_00870]		
Parent Container	DcmDspPid		
Description	Length of a PID in byte(s).		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 255		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

Name	DcmDspPidUsed [ECUC_Dcm_00806]		
Parent Container	DcmDspPid		
Description	Allow to activate or deactivate the usage of a PID, for multi purpose ECUs true = PID is available false = PID is not available		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default Value			
Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL
	Link time	X	VARIANT-LINK-TIME
	Post-build time	X	VARIANT-POST-BUILD
Scope / Dependency	scope: ECU		

Included Containers			
Container Name	Multiplicity	Scope / Dependency	
DcmDspPidData	1..*	This container defines the parameter for a Signal in the PID.	
DcmDspPidSupportInfo	0..*	This container defines the support information (typically byte A) to declare the usability of the data bytes within the so-called packeted PIDs (e.g. PID\$68).	

Figure 10.39: DcmDspPid1 configuration overview

Figure 10.40: DcmDspPid2 configuration overview

Figure 10.41: DcmDspPid3 configuration overview

10.2.5.14.2 DcmDspPidSupportInfo

SWS Item	[ECUC_Dcm_00871]
Container Name	DcmDspPidSupportInfo
Parent Container	DcmDspPid
Description	This container defines the support information (typically byte A) to declare the usability of the data bytes within the so-called packeted PIDs (e.g. PID\$68).
Configuration Parameters	

Name	DcmDspPidSupportInfoLen [ECUC_Dcm_00873]		
Parent Container	DcmDspPidSupportInfo		
Description	Length of the support information in bytes.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 255		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

Name	DcmDspPidSupportInfoPos [ECUC_Dcm_00872]		
Parent Container	DcmDspPidSupportInfo		
Description	Position of the support information in bytes.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 255		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

No Included Containers

10.2.5.14.3 DcmDspPidData

SWS Item	[ECUC_Dcm_00865]
Container Name	DcmDspPidData
Parent Container	DcmDspPid
Description	This container defines the parameter for a Signal in the PID.
Configuration Parameters	

Name	DcmDspPidByteOffset [ECUC_Dcm_01107]		
Parent Container	DcmDspPidData		
Description	This is the position in bytes of the PID structure and will not start at position 0 in case a support information is available (for packeted PIDs).		
Multiplicity	1		
Type	EcclIntegerParamDef		
Range	0 .. 255		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspPidDataByteSize [ECUC_Dcm_01108]		
Parent Container	DcmDspPidData		
Description	Defines the array length in bytes or the the maximum array length for variable datalengths.		
Multiplicity	0..1		
Type	EcclIntegerParamDef		
Range	0 .. 255		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDspPidDataSupportInfo	0..1	This container defines the supported information.
DcmDspPidService01	0..1	Contains specific configuration parameter of PID for service \$01. This container exists only if DcmDspPidService is set to DCM_SERVICE_01 or DCM_SERVICE_01_02.
DcmDspPidService02	0..1	Contains specific configuration parameter of PID for service \$02. This container exists only if DcmDspPidService is set to DCM_SERVICE_02 or DCM_SERVICE_01_02.

10.2.5.14.4 DcmDspPidService01

SWS Item	[ECUC_Dcm_00894]
Container Name	DcmDspPidService01
Parent Container	DcmDspPidData
Description	Contains specific configuration parameter of PID for service \$01. This container exists only if DcmDspPidService is set to DCM_SERVICE_01 or DCM_SERVICE_01_02.
Configuration Parameters	

Name	DcmDspPidDataEndianness [ECUC_Dcm_01012]		
Parent Container	DcmDspPidService01		
Description	<p>Defines the endianness of the data belonging to a PID in a diagnostic response message.</p> <p>If no DcmDspPidDataEndianness is defined the value of DcmDspDataDefaultEndianness is applicable.</p>		
Multiplicity	0..1		
Type	EcucEnumerationParamDef		
Range	BIG_ENDIAN	Most significant byte shall be stored at the lowest address.	
	LITTLE_ENDIAN	Most significant byte shall be stored at the highest address	
	OPAQUE	Opaque data endianness	
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	All Variants

	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspPidDataType [ECUC_Dcm_01018]		
Parent Container	DcmDspPidService01		
Description	Provide the implementation data type of data belonging to a PID.		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	BOOLEAN	Type of the data is boolean.	
	SINT16	Type of the data is sint16.	
	SINT16_N	Type of the data is sint16 array.	
	SINT32	Type of the data is sint32.	
	SINT32_N	Type of the data is sint32 array.	
	SINT8	Type of the data is sint8.	
	SINT8_N	Type of the data is sint8 array.	
	UINT16	Type of the data is uint16.	
	UINT16_N	Type of the data is uint16 array.	
	UINT32	Type of the data is uint32.	
	UINT32_N	Type of the data is uint32 array.	
	UINT8	Type of the data is uint8.	
Post-Build Variant Multiplicity	UINT8_N	Type of the data is uint8 array.	
	false		
Post-Build Variant Value	false

	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspPidDataUsePort [ECUC_Dcm_00720]		
Parent Container	DcmDspPidService01		
Description	<p>If this parameter is set to USE_DATA_SYNCH_FNC, the Dcm will use the function defined in DcmDspPidDataReadFnc to get the PID data value.</p> <p>If this parameter is set to USE_DATA_SYNCH_CLIENT_SERVER, the Dcm will have an R-Port requiring the interface DataServices_{Data}.</p> <p>If this parameter is set to USE_DATA_SENDER_RECEIVER or USE_DATA_SENDER_RECEIVER_AS_SERVICE, the DCM will have an R-Port requiring a SenderReceiverInterface.</p> <p>The R-Port is named DataServices_{Data} where {Data} is the name of the container DcmDspPidData.</p>		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	USE_DATA_SENDER_RECEIVER USE_DATA_SENDER_RECEIVER_AS_SERVICE USE_DATA_SYNCH_CLIENT_SERVER USE_DATA_SYNCH_FNC		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Included Containers			
Container Name	Multiplicity	Scope / Dependency	
DcmDspDiagnosisScaling	0..1	This container contains the configuration (parameters) of an alternative Diagnosis Representation. Out of this the scaling between Diagnosis and ECU internal representation and vice versa can be calculated.	
DcmDspPidService01ExternalSRDataElementClass	0..1	This container defines the source of data in a provided port which shall be read respectively the target of data in a required port which shall be written. This container shall contain either one DcmSubElementInDataElementInstance OR DcmDataElementInstance OR DcmSubElementInImplDataElementInstance reference.	

10.2.5.14.5 DcmDspPidService02

SWS Item	[ECUC_Dcm_00895]
Container Name	DcmDspPidService02
Parent Container	DcmDspPidData

Description	Contains specific configuration parameter of PID for service \$02. This container exists only if DcmDspPidService is set to DCM_SERVICE_02 or DCM_SERVICE_01_02.
--------------------	--

Configuration Parameters

Name	DcmDspPidDataDemRef [ECUC_Dcm_00887]		
Parent Container	DcmDspPidService02		
Description	Reference to DemPidDataElement in DEM configuration. Allows to link the DCM PID and DEM PID configuration for Mode \$02.		
Multiplicity	0..1		
Type	Reference to DemPidDataElement		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—

	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

No Included Containers

10.2.5.14.6 DcmDspPidDataSupportInfo

SWS Item	[ECUC_Dcm_00874]		
Container Name	DcmDspPidDataSupportInfo		
Parent Container	DcmDspPidData		
Description	This container defines the supported information.		

Configuration Parameters

Name	DcmDspPidDataSupportInfoBit [ECUC_Dcm_00876]				
Parent Container	DcmDspPidDataSupportInfo				
Description	Referenced Bit of the SupportInfo				
Multiplicity	1				
Type	EcclIntegerParamDef				
Range	0 .. 255				
Default Value					
Post-Build Variant Value	false				

Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspPidDataSupportInfoRef [ECUC_Dcm_00875]		
Parent Container	DcmDspPidDataSupportInfo		
Description	Reference to DcmDspPidSupportInfo		
Multiplicity	1		
Type	Reference to DcmDspPidSupportInfo		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

No Included Containers

10.2.5.15 DcmDspRequestControl

SWS Item	[ECUC_Dcm_00637]		
Container Name	DcmDspRequestControl		
Parent Container	DcmDsp		
Description	This container contains the configuration (parameters) of the "Request control of on-board system, test or component" service (Service \$08). The DCM will request the control using an R-Port requiring a PortInterface RequestControlServices_{Tid}. The R-Port is named RequestControlServices_{Tid} where {Tid} is the name of the container DcmDspRequestControl.		
Configuration Parameters			

Name	DcmDspRequestControlInBufferSize [ECUC_Dcm_00722]		
Parent Container	DcmDspRequestControl		
Description	Number of bytes to be provided in the input buffer of the interface RequestControlServices_{Tid} for OBD Service \$08		
Multiplicity	1		
Type	EcclIntegerParamDef		
Range	0 .. 255		
Default Value			
Post-Build Variant Value	false		

Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspRequestControlInfoByte [ECUC_Dcm_01078]		
Parent Container	DcmDspRequestControl		
Description	Manufacturer specific value reported to the tester for the record identifiers 0xE000 to 0xE1FF. (WWH-OBD use cases)		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	0 .. 255		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspRequestControlOutBufferSize [ECUC_Dcm_00723]		
Parent Container	DcmDspRequestControl		
Description	Number of bytes to be provided in the output buffer of the interface RequestControlServices_{Tid} for OBD Service \$08		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 255		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspRequestControlTestId [ECUC_Dcm_00656]		
Parent Container	DcmDspRequestControl		
Description	Test Id for Service \$08		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 255		
Default Value			
Post-Build Variant Value	false		

Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD

10.2.5.16 DcmDspRequestFileTransfer

SWS Item	[ECUC_Dcm_01034]
Container Name	DcmDspRequestFileTransfer
Parent Container	DcmDsp
Description	This container contains the configuration for RequestFileTransfer. This container only exists if RequestFileTransfer is configured.
Configuration Parameters	

Name	DcmRequestFileTransferFileSizeOrDirInfoParameterLength [ECUC_Dcm_01035]		
Parent Container	DcmDspRequestFileTransfer		
Description	Defines the length (number of bytes, i.e. the value of fileSizeOrDirInfoParameterLength) of the fileSizeUncompressedOrDirInfoLength and fileSizeCompressed in the response of RequestFileTransfer.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	1 .. 4		
Default Value	4		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmRequestFileTransferLengthFormatIdentifier [ECUC_Dcm_01036]		
Parent Container	DcmDspRequestFileTransfer		
Description	Defines the length (number of bytes) of the maxNumberOfBlockLength parameter in the response of RequestFileTransfer.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	1 .. 4		
Default Value	4		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmRequestFileTransferMaxFileAndDirName [ECUC_Dcm_01130]		
Parent Container	DcmDspRequestFileTransfer		
Description	Defines the maximum size allowed for the FileAndDirName parameter with RTE interfaces used for RequestFileTransfer.		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	1 .. 65535		
Default Value	1		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmRequestFileTransferUsePort [ECUC_Dcm_01131]		
Parent Container	DcmDspRequestFileTransfer		
Description	Defines if a C/S or C function call shall be used for RequestFileTransfer processing.		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default Value	false		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU

10.2.5.17 Response on Event

10.2.5.17.1 DcmDspRoe

SWS Item	[ECUC_Dcm_00858]
Container Name	DcmDspRoe

Parent Container	DcmDsp
Description	Provide the configuration of the ResponseOnEvent mechanism.
Configuration Parameters	

Name	DcmDspRoeInterMessageTime [ECUC_Dcm_00856]		
Parent Container	DcmDspRoe		
Description	Provide the minimum time in seconds between two transmissions of ROE event. It is used for the delay between two different consecutive Roe transmissions.		
Multiplicity	1		
Type	EcucFloatParamDef		
Range	[0 .. 5]		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: local		

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDspRoeEvent	1..255	<p>This container contains a list of all supported Roe eventTypeRecords which are accepted by this ECU.</p> <p>At most one DcmDspRoeEvent container is allowed to define a DcmDspRoeEventProperties container with the choice DcmDspRoeOnDTCStatusChange.</p>
DcmDspRoeEventWindowTime	1..*	<p>This container configures the available EventWindowTime in this Ecu.</p> <p>This container contains a sub-set of EventWindowTimes supported by the Dcm, to limit the Ecu resources.</p>

Figure 10.44: DcmDspRoe configuration overview

10.2.5.17.2 DcmDspRoeEvent

SWS Item	[ECUC_Dcm_00973]
Container Name	DcmDspRoeEvent
Parent Container	DcmDspRoe

Description	<p>This container contains a list of all supported Roe eventTypeRecords which are accepted by this ECU.</p> <p>At most one DcmDspRoeEvent container is allowed to define a DcmDspRoeEventProperties container with the choice DcmDspRoeOnDTCStatusChange.</p>
--------------------	---

Configuration Parameters

Name	DcmDspRoeEventId [ECUC_Dcm_00976]		
Parent Container	DcmDspRoeEvent		
Description	<p>EventId for a global identification of this ROE event it is used within APIs Dcm_TriggerOnEvent() and the ModeDeclarationGroup.</p> <p>The ratio Ids should be sequentially ordered beginning with 0 and no gaps in between.</p>		
Multiplicity	1		
Type	EcucIntegerParamDef (Symbolic Name generated for this parameter)		
Range	0 .. 254		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time Link time Post-build time	X	All Variants
Scope / Dependency	scope: local		

Name	DcmDspRoeInitialEventStatus [ECUC_Dcm_00980]		
Parent Container	DcmDspRoeEvent		
Description	Initial Roe status of this RoeEvent		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	DCM_ROE_CLEARED		
Default Value	DCM_ROE_CLEARED		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time Link time Post-build time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
Scope / Dependency	scope: local		

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDspRoeEventProperties	1	<p>This container contains the properties of Roe eventTypeRecords.</p> <p>In one DcmDspRoeEventProperties container one DcmDspRoeOnDTCStatusChange or DcmDspRoeOnChangeOfDatalIdentifier container shall be defined.</p>

10.2.5.17.3 DcmDspRoeEventProperties

SWS Item	[ECUC_Dcm_00978]
Container Name	DcmDspRoeEventProperties
Parent Container	DcmDspRoeEvent
Description	<p>This container contains the properties of Roe eventTypeRecords.</p> <p>In one DcmDspRoeEventProperties container one DcmDspRoeOnDTCStatusChange or DcmDspRoeOnChangeOfDatalIdentifier container shall be defined.</p>
Configuration Parameters	

Container Choices		
Container Name	Multiplicity	Scope / Dependency
DcmDspRoeOnChangeOfDatalIdentifier	0..1	This container contains the eventTypeRecord supported for onChangeOfDatalIdentifier eventType.
DcmDspRoeOnDTCStatusChange	0..1	This container contains the eventTypeRecord supported for onDTCStatusChange eventType.

10.2.5.17.4 DcmDspRoeOnChangeOfDatalIdentifier

SWS Item	[ECUC_Dcm_00975]
Container Name	DcmDspRoeOnChangeOfDatalIdentifier
Parent Container	DcmDspRoeEventProperties
Description	This container contains the eventTypeRecord supported for onChangeOfDatalIdentifier eventType.
Configuration Parameters	

Name	DcmDspRoeDidRef [ECUC_Dcm_00979]
Parent Container	DcmDspRoeOnChangeOfDatalIdentifier
Description	Reference to a Did which is watched.
Multiplicity	1
Type	Reference to DcmDspDid
Post-Build Variant Value	false

Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: local		

No Included Containers

10.2.5.17.5 DcmDspRoeOnDTCStatusChange

SWS Item	[ECUC_Dcm_00974]		
Container Name	DcmDspRoeOnDTCStatusChange		
Parent Container	DcmDspRoeEventProperties		
Description	This container contains the eventTypeRecord supported for onDTCStatusChange eventType.		
Configuration Parameters			

Name	DcmDspRoeDTCStatusMask [ECUC_Dcm_01109]		
Parent Container	DcmDspRoeOnDTCStatusChange		
Description	Value of the relevant DTCStatusMask		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	0 .. 255		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: local		

No Included Containers

10.2.5.17.6 DcmDspRoeEventWindowTime

SWS Item	[ECUC_Dcm_00981]		
Container Name	DcmDspRoeEventWindowTime		
Parent Container	DcmDspRoe		
Description	This container configures the available EventWindowTime in this Ecu. This container contains a sub-set of EventWindowTimes supported by the Dcm, to limit the Ecu resources.		

Configuration Parameters

Name	DcmDspRoeEventWindowTime [ECUC_Dcm_00982]		
Parent Container	DcmDspRoeEventWindowTime		
Description	Value of the EventWindowTime		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	DCM_ROE_EVENT_WIN DOW_CURRENT_AND_FOLLOWING_CYCLE		
	DCM_ROE_EVENT_WIN DOW_CURRENT_CYCLE		
	DCM_ROE_EVENT_WIN DOW_INFINITE		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: local		

No Included Containers

10.2.5.18 Routines

Figure 10.45: DcmDspRoutine configuration overview

10.2.5.18.1 DcmDspRoutine

SWS Item	[ECUC_Dcm_00640]
Container Name	DcmDspRoutine
Parent Container	DcmDsp
Description	This container contains the configuration (parameters) for Routines
Configuration Parameters	

Name	DcmDspRoutineIdentifier [ECUC_Dcm_00641]		
Parent Container	DcmDspRoutine		
Description	<p>2 bytes Identifier of the RID</p> <p>Within each DcmConfigSet all DcmDspRoutineIdentifier values shall be unique.</p>		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 65535		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

Name	DcmDspRoutineInfoByte [ECUC_Dcm_01063]		
Parent Container	DcmDspRoutine		
Description	Manufacturer specific value reported to the tester for the record identifiers 0xE000 to 0xE1FF. (OBD use cases)		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	0 .. 255		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: ECU		

Name	DcmDspRoutineUsed [ECUC_Dcm_00807]		
Parent Container	DcmDspRoutine		
Description	<p>Allow to activate or deactivate the usage of a Routine, for multi purpose ECUs</p> <p>True = Routine is available False = Routine is not available</p>		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default Value			
Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL
	Link time	X	VARIANT-LINK-TIME
	Post-build time	X	VARIANT-POST-BUILD
Scope / Dependency	scope: ECU		

Name	DcmDspRoutineUsePort [ECUC_Dcm_00724]		
Parent Container	DcmDspRoutine		
Description	<p>If this parameter is set to true, the DCM uses a port requiring a PortInterface RoutineServices_{RoutineName}.</p> <p>The R-Port is named RoutineServices_{RoutineName} where {RoutineName} is the name of the container DcmDspRoutine. In that case, the configuration must not provide function names in DcmDspStartRoutineFnc, DcmDspStopRoutineFnc or DcmDspRequestResultsRoutineFnc. If this is false, the DCM expects to find the names of the functions to be used in DcmDspStartRoutineFnc, DcmDspStopRoutineFnc or DcmDspRequestResultsRoutineFnc.</p>		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Included Containers			
Container Name	Multiplicity	Scope / Dependency	
DcmDspRequestRoutineResults	0..1	Provides the configuration of RequestResult subservice for RoutineControl service. Existence indicates that the RequestRoutineResults in the RoutineControl is supported.	
DcmDspStartRoutine	0..1	Provides the configuration of Start subservice for RoutineControl service.	
DcmDspStopRoutine	0..1	Provides the configuration of Stop subservice for RoutineControl service. Existence indicates that the StopRoutine in the RoutineControl is supported.	

10.2.5.18.2 DcmDspRequestRoutineResults

SWS Item	[ECUC_Dcm_01023]
Container Name	DcmDspRequestRoutineResults
Parent Container	DcmDspRoutine
Description	Provides the configuration of RequestResult subservice for RoutineControl service. Existence indicates that the RequestRoutineResults in the RoutineControl is supported.
Configuration Parameters	

Name	DcmDspRequestRoutineResultsConfirmationEnabled [ECUC_Dcm_01091]		
Parent Container	DcmDspRequestRoutineResults		
Description	Allows to enable/disable the confirmation function to indicate the transmission of a response to a RequestRoutineResults request		
Multiplicity	0..1		
Type	EcucBooleanParamDef		
Default Value	false		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspRequestRoutineResultsConfirmationFnc [ECUC_Dcm_01090]		
Parent Container	DcmDspRequestRoutineResults		
Description	C-function to call if a transmission confirmation is needed by the issuer (BSW module)		
Multiplicity	0..1		
Type	EcucFunctionNameDef		
Default Value			
Regular Expression			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspRequestRoutineResultsFnc [ECUC_Dcm_00753]		
Parent Container	DcmDspRequestRoutineResults		
Description	<p>Function name for request to application the results of a routine. (Routine_RequestResults-function)</p> <p>This parameter is related to the interface Xxx_RequestResults.</p>		
Multiplicity	0..1		
Type	EcucFunctionNameDef		
Default Value			
Regular Expression			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time Link time Post-build time	X	All Variants
Value Configuration Class	Pre-compile time Link time Post-build time	X	All Variants
Scope / Dependency	scope: ECU		

Name	DcmDspRequestRoutineResultsRole [ECUC_Dcm_01146]		
Parent Container	DcmDspRequestRoutineResults		
Description	<p>Bitfield were each bit represents one dedicated role. A RoutineControl with sub-function requestResults is granted access if the bit value is 1. If a bit value is 0, the routine is not allowed for that role.</p>		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	0 .. 4294967295		
Default Value			
Post-Build Variant Multiplicity	true		
Post-Build Variant Value	true		
Multiplicity Configuration Class	Pre-compile time Link time Post-build time	X	VARIANT-PRE-COMPIL
Value Configuration Class	Pre-compile time Link time Post-build time	X	VARIANT-LINK-TIME
Scope / Dependency	scope: ECU		

Name	DcmDspRoutineInterfaceArgumentIntegrity [ECUC_Dcm_01184]		
Parent Container	DcmDspRequestRoutineResults		
Description	Defines the value of ClientServerOperation.diagArgIntegrity for the created C/S interface of this routine		
Multiplicity	0..1		
Type	EcucBooleanParamDef		
Default Value	false		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspRequestRoutineResultsCommonAuthorizationRef [ECUC_Dcm_01054]		
Parent Container	DcmDspRequestRoutineResults		
Description	Reference to DcmDspCommonAuthorization Common authorization configuration taken from the referenced DcmDspRequestRoutineResultsCommonAuthorizationRef. If there is no reference, no check on the commonly defined authorization conditions shall be done to get the routine result.		
Multiplicity	0..1		
Type	Reference to DcmDspCommonAuthorization		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDspRequestRoutineResultsInResultsIn	0..1	Provide description of input parameter of RequestResult subservice for RoutineControl service.

DcmDspRequestRoutineResultsOut	0..1	Provide description of output parameter of RequestResult subservice for RoutineControl service.
--------------------------------	------	---

Figure 10.46: DcmDspRequestRoutineResults configuration overview

10.2.5.18.3 DcmDspRequestRoutineResultsIn

SWS Item	[ECUC_Dcm_01116]
Container Name	DcmDspRequestRoutineResultsIn
Parent Container	DcmDspRequestRoutineResults
Description	Provide description of input parameter of RequestResult subservice for RoutineControl service.

Configuration Parameters

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDspRequestRoutineResultsInSignal	1..*	<p>Provides description of a routine signal used in RoutineControl service.</p> <p>The ordering defined via the index attribute of the subcontainers in this list represents the order of the dataIn_n elements in the XXX_RequestResult function call.</p>

10.2.5.18.4 DcmDspRequestRoutineResultsInSignal

SWS Item	[ECUC_Dcm_01117]
Container Name	DcmDspRequestRoutineResultsInSignal
Parent Container	DcmDspRequestRoutineResultsIn
Description	<p>Provides description of a routine signal used in RoutineControl service.</p> <p>The ordering defined via the index attribute of the subcontainers in this list represents the order of the dataIn_n elements in the XXX_RequestResult function call.</p> <p>Attributes: requiresIndex=true</p>

Configuration Parameters

Name	DcmDspRoutineParameterSize [ECUC_Dcm_01119]				
Parent Container	DcmDspRequestRoutineResultsInSignal				
Description	Provide the size of a RoutineControl parameter in bytes				
Multiplicity	0..1				
Type	EcucIntegerParamDef				
Range	0 .. 65535				
Default Value					
Post-Build Variant Multiplicity	false				
Post-Build Variant Value	false				
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD		
	Link time	X	VARIANT-LINK-TIME		
	Post-build time	—			
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD		
	Link time	X	VARIANT-LINK-TIME		
	Post-build time	—			
Scope / Dependency	scope: ECU				

Name	DcmDspRoutineSignalEndianness [ECUC_Dcm_01121]		
Parent Container	DcmDspRequestRoutineResultsInSignal		
Description	Defines the endianness of the data belonging to a Routine In Signal for RequestResult subfunction.		
Multiplicity	0..1		
Type	EcucEnumerationParamDef		
Range	BIG_ENDIAN	Most significant byte shall be stored at the lowest address.	
	LITTLE_ENDIAN	Most significant byte shall be stored at the highest address	
	OPAQUE	Opaque data endianness	
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspRoutineSignalPos [ECUC_Dcm_01118]		
Parent Container	DcmDspRequestRoutineResultsInSignal		
Description	Provide the position of the signal in the RoutineControl request/response. The position is defined in bits.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 65535		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspRoutineSignalType [ECUC_Dcm_01120]		
Parent Container	DcmDspRequestRoutineResultsInSignal		
Description	Provide the type of the signal in the RoutineControl request/response.		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	BOOLEAN	Type of the signal is boolean.	
	FLOAT	Type of the data is float.	
	FLOAT_N	Type of the data is float array.	
	SINT16	Type of the signal is sint16.	

	SINT16_N	Type of the signal is sint16 array.
	SINT32	Type of the signal is sint32.
	SINT32_N	Type of the signal is sint32 array.
	SINT8	Type of the signal is sint8.
	SINT8_N	Type of the signal is sint8 array.
	UINT16	Type of the signal is uint16.
	UINT16_N	Type of the signal is uint16 array.
	UINT32	Type of the signal is uint32.
	UINT32_N	Type of the signal is uint32 array.
	UINT8	Type of the signal is uint8.
	UINT8_N	Type of the signal is uint8 array.
Post-Build Variant Value	VARIABLE_LENGTH	Type of the signal is uint8[DcmDspRoutineParameterSize]. This is only valid for the last signal and when DcmDspRoutineSignalType is set to VARIABLE_LENGTH.
	false	
Value Configuration Class	Pre-compile time	X VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X VARIANT-LINK-TIME
	Post-build time	—
Scope / Dependency	scope: ECU	

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDspArgument Scaling	0..1	This container contains the configuration (arguments) of an alternative Diagnosis Representation. Out of this the scaling between Diagnosis and ECU internal representation and vice versa can be calculated.

10.2.5.18.5 DcmDspRequestRoutineResultsOut

SWS Item	[ECUC_Dcm_00831]
Container Name	DcmDspRequestRoutineResultsOut
Parent Container	DcmDspRequestRoutineResults
Description	Provide description of output parameter of RequestResult subservice for RoutineControl service.
Configuration Parameters	

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDspRequestRoutine ResultsOutSignal	1..*	<p>Provides description of a routine signal used in RoutineControl service.</p> <p>The ordering defined via the index attribute of the subcontainers in this list represents the order of the dataOutN elements in the XXX_RequestResult function call.</p>

10.2.5.18.6 DcmDspRequestRoutineResultsOutSignal

SWS Item	[ECUC_Dcm_00836]
Container Name	DcmDspRequestRoutineResultsOutSignal
Parent Container	DcmDspRequestRoutineResultsOut
Description	<p>Provides description of a routine signal used in RoutineControl service.</p> <p>The ordering defined via the index attribute of the subcontainers in this list represents the order of the dataOutN elements in the XXX_RequestResult function call.</p> <p>Attributes: requiresIndex=true</p>
Configuration Parameters	

Name	DcmDspRoutineParameterSize [ECUC_Dcm_00838]		
Parent Container	DcmDspRequestRoutineResultsOutSignal		
Description	Provide the size of a RoutineControl parameter in bytes		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	0 .. 65535		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD

	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspRoutineSignalPos [ECUC_Dcm_00837]		
Parent Container	DcmDspRequestRoutineResultsOutSignal		
Description	Provide the position of the signal in the RoutineControl request/response. The position is defined in bits.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 65535		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspRoutineSignalType [ECUC_Dcm_00881]		
Parent Container	DcmDspRequestRoutineResultsOutSignal		
Description	Provide the type of the signal in the RoutineControl request/response.		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	BOOLEAN	Type of the signal is boolean.	
	FLOAT	Type of the data is float.	
	FLOAT_N	Type of the data is float array.	
	SINT16	Type of the signal is sint16.	
	SINT16_N	Type of the signal is sint16 array.	
	SINT32	Type of the signal is sint32.	
	SINT32_N	Type of the signal is sint32 array.	
	SINT8	Type of the signal is sint8.	
	SINT8_N	Type of the signal is sint8 array.	
	UINT16	Type of the signal is uint16.	
	UINT16_N	Type of the signal is uint16 array.	
	UINT32	Type of the signal is uint32.	
	UINT32_N	Type of the signal is uint32 array.	
	UINT8	Type of the signal is uint8.	
	UINT8_N	Type of the signal is uint8 array.	

Post-Build Variant Value	VARIABLE_LENGTH false	Type of the signal is uint8[DcmDspRoutineParameterSize]. This is only valid for the last signal and when DcmDspRoutineSignalType is set to VARIABLE_LENGTH.
Value Configuration Class	Pre-compile time	X VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X VARIANT-LINK-TIME
	Post-build time	—
Scope / Dependency	scope: ECU	

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDspArgument Scaling	0..1	This container contains the configuration (arguments) of an alternative Diagnosis Representation. Out of this the scaling between Diagnosis and ECU internal representation and vice versa can be calculated.

10.2.5.18.7 DcmDspStartRoutine

SWS Item	[ECUC_Dcm_01021]
Container Name	DcmDspStartRoutine
Parent Container	DcmDspRoutine
Description	Provides the configuration of Start subservice for RoutineControl service.
Configuration Parameters	

Name	DcmDspRoutineInterfaceArgumentIntegrity [ECUC_Dcm_01184]		
Parent Container	DcmDspStartRoutine		
Description	Defines the value of ClientServerOperation.diagArgIntegrity for the created C/S interface of this routine		
Multiplicity	0..1		
Type	EcucBooleanParamDef		
Default Value	false		
Post-Build Variant Multiplicity	false

SWS Item [ECUC_Dcm_00845]

Container Name	DcmDspStartRoutineInSignal
Parent Container	DcmDspStartRoutineIn
Description	<p>Provide description of a routine signal used in RoutineControl service.</p> <p>The ordering defined via the index attribute of the subcontainers in this list represents the order of the dataInN elements in the XXX_Start function call.</p> <p>Attributes: requiresIndex=true</p>

Configuration Parameters

Name	DcmDspRoutineParameterSize [ECUC_Dcm_00847]		
Parent Container	DcmDspStartRoutineInSignal		
Description	Provide the size of a RoutineControl parameter in bytes		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	0 .. 65535		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspRoutineSignalEndianness [ECUC_Dcm_01016]		
Parent Container	DcmDspStartRoutineInSignal		
Description	Defines the endianness of the data belonging to a Routine In Signal for Start subfunction.		
Multiplicity	0..1		
Type	EcucEnumerationParamDef		
Range	BIG_ENDIAN	Most significant byte shall be stored at the lowest address.	
	LITTLE_ENDIAN	Most significant byte shall be stored at the highest address	
	OPAQUE	Opaque data endianness	
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		

Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspRoutineSignalPos [ECUC_Dcm_00846]		
Parent Container	DcmDspStartRoutineInSignal		
Description	Provide the position of the signal in the RoutineControl request/response. The position is defined in bits.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 65535		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspRoutineSignalType [ECUC_Dcm_00884]		
Parent Container	DcmDspStartRoutineInSignal		
Description	Provide the type of the signal in the RoutineControl request/response.		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	BOOLEAN	Type of the signal is boolean.	
	FLOAT	Type of the data is float.	
	FLOAT_N	Type of the data is float array.	
	SINT16	Type of the signal is sint16.	
	SINT16_N	Type of the signal is sint16 array.	
	SINT32	Type of the signal is sint32.	
	SINT32_N	Type of the signal is sint32 array.	
	SINT8	Type of the signal is sint8.	
	SINT8_N	Type of the signal is sint8 array.	
	UINT16	Type of the signal is uint16.	
	UINT16_N	Type of the signal is uint16 array.	
	UINT32	Type of the signal is uint32.	
	UINT32_N	Type of the signal is uint32 array.	
	UINT8	Type of the signal is uint8.	
	UINT8_N	Type of the signal is uint8 array.	

Post-Build Variant Value	VARIABLE_LENGTH false	Type of the signal is uint8[DcmDspRoutineParameterSize]. This is only valid for the last signal and when DcmDspRoutineSignalType is set to VARIABLE_LENGTH.
Value Configuration Class	Pre-compile time	X VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X VARIANT-LINK-TIME
	Post-build time	-
Scope / Dependency	scope: ECU	

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDspArgument Scaling	0..1	This container contains the configuration (arguments) of an alternative Diagnosis Representation. Out of this the scaling between Diagnosis and ECU internal representation and vice versa can be calculated.

10.2.5.18.10 DcmDspStartRoutineOut

SWS Item	[ECUC_Dcm_00835]
Container Name	DcmDspStartRoutineOut
Parent Container	DcmDspStartRoutine
Description	Provide description of output parameter of Start subservice for RoutineControl service.
Configuration Parameters	

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDspStartRoutineOut Signal	1..*	Provide description of a routine signal used in RoutineControl service. The ordering defined via the index attribute of the subcontainers in this list represents the order of the dataOutN elements in the XXX_Start function call.

Figure 10.49: DcmDspStartRoutineOut configuration overview

10.2.5.18.11 DcmDspStartRoutineOutSignal

SWS Item

[ECUC_Dcm_00848]

Container Name	DcmDspStartRoutineOutSignal
Parent Container	DcmDspStartRoutineOut
Description	<p>Provide description of a routine signal used in RoutineControl service.</p> <p>The ordering defined via the index attribute of the subcontainers in this list represents the order of the dataOutN elements in the XXX_Start function call.</p> <p>Attributes: requiresIndex=true</p>

Configuration Parameters

Name	DcmDspRoutineParameterSize [ECUC_Dcm_00850]		
Parent Container	DcmDspStartRoutineOutSignal		
Description	Provide the size of a RoutineControl parameter in bytes		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	0 .. 65535		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME

	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspRoutineSignalEndianness [ECUC_Dcm_01017]		
Parent Container	DcmDspStartRoutineOutSignal		
Description	Defines the endianness of the data belonging to a Routine Out Signal for Start subfunction.		
Multiplicity	0..1		
Type	EcucEnumerationParamDef		
Range	BIG_ENDIAN	Most significant byte shall be stored at the lowest address.	
	LITTLE_ENDIAN	Most significant byte shall be stored at the highest address	
	OPAQUE	Opaque data endianness	
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		

Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspRoutineSignalPos [ECUC_Dcm_00867]		
Parent Container	DcmDspStartRoutineOutSignal		
Description	Provide the position of the signal in the RoutineControl request/response. The position is defined in bits.		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	0 .. 65535		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspRoutineSignalType [ECUC_Dcm_00885]		
Parent Container	DcmDspStartRoutineOutSignal		
Description	Provide the type of the signal in the RoutineControl request/response.		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	BOOLEAN	Type of the signal is boolean.	
	FLOAT	Type of the data is float.	
	FLOAT_N	Type of the data is float array.	
	SINT16	Type of the signal is sint16.	
	SINT16_N	Type of the signal is sint16 array.	
	SINT32	Type of the signal is sint32.	
	SINT32_N	Type of the signal is sint32 array.	
	SINT8	Type of the signal is sint8.	
	SINT8_N	Type of the signal is sint8 array.	
	UINT16	Type of the signal is uint16.	
	UINT16_N	Type of the signal is uint16 array.	
	UINT32	Type of the signal is uint32.	

Post-Build Variant Value	UINT32_N	Type of the signal is uint32 array.			
	UINT8	Type of the signal is uint8.			
	UINT8_N	Type of the signal is uint8 array.			
	VARIABLE_LENGTH	Type of the signal is uint8[DcmDspRoutineParameterSize]. This is only valid for the last signal and when DcmDspRoutineSignalType is set to VARIABLE_LENGTH.			
Value Configuration Class	Pre-compile time X VARIANT-PRE-COMPIL Link time X VARIANT-LINK-TIME Post-build time –				
Scope / Dependency	scope: ECU				

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDspArgumentScaling	0..1	This container contains the configuration (arguments) of an alternative Diagnosis Representation. Out of this the scaling between Diagnosis and ECU internal representation and vice versa can be calculated.

10.2.5.18.12 DcmDspStopRoutine

SWS Item	[ECUC_Dcm_01022]
Container Name	DcmDspStopRoutine
Parent Container	DcmDspRoutine
Description	Provides the configuration of Stop subservice for RoutineControl service. Existence indicates that the StopRoutine in the RoutineControl is supported.
Configuration Parameters	

Name	DcmDspRoutineInterfaceArgumentIntegrity [ECUC_Dcm_01184]		
Parent Container	DcmDspStopRoutine		
Description	Defines the value of ClientServerOperation.diagArgIntegrity for the created C/S interface of this routine		
Multiplicity	0..1		
Type	EcucBooleanParamDef		
Default Value	false		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time X All Variants Link time – Post-build time –		

Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspStopRoutineConfirmationEnabled [ECUC_Dcm_01095]		
Parent Container	DcmDspStopRoutine		
Description	Allows to enable/disable the confirmation function to indicate the transmission of a response to a StopRoutine request		
Multiplicity	0..1		
Type	EcucBooleanParamDef		
Default Value	false		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspStopRoutineConfirmationFnc [ECUC_Dcm_01096]		
Parent Container	DcmDspStopRoutine		
Description	C-function to call if a transmission confirmation is needed by the issuer (BSW module)		
Multiplicity	0..1		
Type	EcucFunctionNameDef		
Default Value			
Regular Expression			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspStopRoutineFnc [ECUC_Dcm_00752]		
Parent Container	DcmDspStopRoutine		
Description	<p>Function name for request to application to stop a routine. (Routine_Stop-function)</p> <p>This parameter is related to the interface Xxx_Stop.</p>		
Multiplicity	0..1		
Type	EcucFunctionNameDef		
Default Value			
Regular Expression			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time Link time Post-build time	X	All Variants
Value Configuration Class	Pre-compile time Link time Post-build time	X	All Variants
Scope / Dependency	scope: ECU		

Name	DcmDspStopRoutineRole [ECUC_Dcm_01145]		
Parent Container	DcmDspStopRoutine		
Description	Bitfield were each bit represents one dedicated role. A RoutineControl with sub-function stopRoutine is granted access if the bit value is 1. If a bit value is 0, the routine is not allowed for that role.		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	0 .. 4294967295		
Default Value			
Post-Build Variant Multiplicity	true		
Post-Build Variant Value	true		
Multiplicity Configuration Class	Pre-compile time Link time Post-build time	X	VARIANT-PRE-COMPIL
Value Configuration Class	Pre-compile time Link time Post-build time	X	VARIANT-LINK-TIME
Scope / Dependency	scope: ECU		

Name	DcmDspStopRoutineCommonAuthorizationRef [ECUC_Dcm_01053]		
Parent Container	DcmDspStopRoutine		
Description	<p>Reference to DcmDspCommonAuthorization</p> <p>Common authorization configuration taken from the referenced DcmDspStopRoutineCommonAuthorizationRef. If there is no reference, no check on the commonly defined authorization conditions shall be done to stop the routine.</p>		
Multiplicity	0..1		
Type	Reference to DcmDspCommonAuthorization		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDspStopRoutineIn	0..1	Provide description of input parameter of Stop subservice for RoutineControl service.
DcmDspStopRoutineOut	0..1	Provide description of output parameter of Stop subservice for RoutineControl service.

Figure 10.50: DcmDspStopRoutine configuration overview

10.2.5.18.13 DcmDspStopRoutineIn

SWS Item	[ECUC_Dcm_00832]
Container Name	DcmDspStopRoutineIn
Parent Container	DcmDspStopRoutine
Description	Provide description of input parameter of Stop subservice for RoutineControl service.
Configuration Parameters	

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDspStopRoutineIn Signal	1..*	<p>Provide description of a routine signal used in RoutineControl service.</p> <p>The ordering defined via the index attribute of the subcontainers in this list represents the order of the dataInN elements in the XXX_Stop function call.</p>

Figure 10.51: **DcmDspRoutineStopIn** configuration overview

10.2.5.18.14 DcmDspStopRoutineInSignal

SWS Item	[ECUC_Dcm_00839]
----------	------------------

Container Name	DcmDspStopRoutineInSignal
Parent Container	DcmDspStopRoutineIn
Description	<p>Provide description of a routine signal used in RoutineControl service.</p> <p>The ordering defined via the index attribute of the subcontainers in this list represents the order of the dataInN elements in the XXX_Stop function call.</p> <p>Attributes: requiresIndex=true</p>

Configuration Parameters

Name	DcmDspRoutineParameterSize [ECUC_Dcm_00841]		
Parent Container	DcmDspStopRoutineInSignal		
Description	Provide the size of a RoutineControl parameter in bytes		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	0 .. 65535		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspRoutineSignalEndianness [ECUC_Dcm_01014]		
Parent Container	DcmDspStopRoutineInSignal		
Description	Defines the endianness of the data belonging to a Routine In Signal for Stop subfunction.		
Multiplicity	0..1		
Type	EcucEnumerationParamDef		
Range	BIG_ENDIAN	Most significant byte shall be stored at the lowest address.	
	LITTLE_ENDIAN	Most significant byte shall be stored at the highest address	
	OPAQUE	Opaque data endianness	
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		

Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspRoutineSignalPos [ECUC_Dcm_00840]		
Parent Container	DcmDspStopRoutineInSignal		
Description	Provide the position of the signal in the RoutineControl request/response. The position is defined in bits.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 65535		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspRoutineSignalType [ECUC_Dcm_00882]		
Parent Container	DcmDspStopRoutineInSignal		
Description	Provide the type of the signal in the RoutineControl request/response.		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	BOOLEAN	Type of the signal is boolean.	
	FLOAT	Type of the data is float.	
	FLOAT_N	Type of the data is float array.	
	SINT16	Type of the signal is sint16.	
	SINT16_N	Type of the signal is sint16 array.	
	SINT32	Type of the signal is sint32.	
	SINT32_N	Type of the signal is sint32 array.	
	SINT8	Type of the signal is sint8.	
	SINT8_N	Type of the signal is sint8 array.	
	UINT16	Type of the signal is uint16.	
	UINT16_N	Type of the signal is uint16 array.	
	UINT32	Type of the signal is uint32.	
	UINT32_N	Type of the signal is uint32 array.	
	UINT8	Type of the signal is uint8.	
	UINT8_N	Type of the signal is uint8 array.	

Post-Build Variant Value	VARIABLE_LENGTH false	Type of the signal is uint8[DcmDspRoutineParameterSize]. This is only valid for the last signal and when DcmDspRoutineSignalType is set to VARIABLE_LENGTH.
Value Configuration Class	Pre-compile time	X VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X VARIANT-LINK-TIME
	Post-build time	-
Scope / Dependency	scope: ECU	

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDspArgument Scaling	0..1	This container contains the configuration (arguments) of an alternative Diagnosis Representation. Out of this the scaling between Diagnosis and ECU internal representation and vice versa can be calculated.

10.2.5.18.15 DcmDspStopRoutineOut

SWS Item	[ECUC_Dcm_00833]
Container Name	DcmDspStopRoutineOut
Parent Container	DcmDspStopRoutine
Description	Provide description of output parameter of Stop subservice for RoutineControl service.
Configuration Parameters	

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDspStopRoutineOut Signal	1..*	Provide description of a routine signal used in RoutineControl service. The ordering defined via the index attribute of the subcontainers in this list represents the order of the dataOutN elements in the XXX_Stop function call.

Figure 10.52: DcmDspStopRoutineOut configuration overview

10.2.5.18.16 DcmDspStopRoutineOutSignal

SWS Item	[ECUC_Dcm_00842]
Container Name	DcmDspStopRoutineOutSignal
Parent Container	DcmDspStopRoutineOut
Description	<p>Provide description of a routine signal used in RoutineControl service.</p> <p>The ordering defined via the index attribute of the subcontainers in this list represents the order of the dataOutN elements in the XXX_Stop function call.</p> <p>Attributes: requiresIndex=true</p>
Configuration Parameters	

Name	DcmDspRoutineParameterSize [ECUC_Dcm_00844]		
Parent Container	DcmDspStopRoutineOutSignal		
Description	Provide the size of a RoutineControl parameter in bytes		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	0 .. 65535		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspRoutineSignalEndianness [ECUC_Dcm_01015]		
Parent Container	DcmDspStopRoutineOutSignal		
Description	Defines the endianness of the data belonging to a Routine Out Signal for Stop subfunction.		
Multiplicity	0..1		
Type	EcucEnumerationParamDef		
Range	BIG_ENDIAN	Most significant byte shall be stored at the lowest address.	
	LITTLE_ENDIAN	Most significant byte shall be stored at the highest address	
	OPAQUE	Opaque data endianness	
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		

Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspRoutineSignalPos [ECUC_Dcm_00843]		
Parent Container	DcmDspStopRoutineOutSignal		
Description	Provide the position of the signal in the RoutineControl request/response. The position is defined in bits.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 65535		
Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmDspRoutineSignalType [ECUC_Dcm_00883]		
Parent Container	DcmDspStopRoutineOutSignal		
Description	Provide the type of the signal in the RoutineControl request/response.		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	BOOLEAN	Type of the signal is boolean.	
	FLOAT	Type of the data is float.	
	FLOAT_N	Type of the data is float array.	
	SINT16	Type of the signal is sint16.	
	SINT16_N	Type of the signal is sint16 array.	
	SINT32	Type of the signal is sint32.	
	SINT32_N	Type of the signal is sint32 array.	
	SINT8	Type of the signal is sint8.	
	SINT8_N	Type of the signal is sint8 array.	
	UINT16	Type of the signal is uint16.	
	UINT16_N	Type of the signal is uint16 array.	
	UINT32	Type of the signal is uint32.	
	UINT32_N	Type of the signal is uint32 array.	
	UINT8	Type of the signal is uint8.	
	UINT8_N	Type of the signal is uint8 array.	

Post-Build Variant Value	VARIABLE_LENGTH false	Type of the signal is uint8[DcmDspRoutineParameterSize]. This is only valid for the last signal and when DcmDspRoutineSignalType is set to VARIABLE_LENGTH.
Value Configuration Class	Pre-compile time	X VARIANT-PRE-COMPILE, VARIANT-POST-BUILD
	Link time	X VARIANT-LINK-TIME
	Post-build time	-
Scope / Dependency	scope: ECU	

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDspArgument Scaling	0..1	This container contains the configuration (arguments) of an alternative Diagnosis Representation. Out of this the scaling between Diagnosis and ECU internal representation and vice versa can be calculated.

10.2.5.19 Session Security and Modes

10.2.5.19.1 DcmDspSecurity

SWS Item	[ECUC_Dcm_00764]
Container Name	DcmDspSecurity
Parent Container	DcmDsp
Description	This container contains the configuration (DSP parameter) for security level configuration (per security level) Description This container contains Rows of DcmDspSecurityRow
Configuration Parameters	

Name	DcmDspSecurityMaxAttemptCounterReadoutTime [ECUC_Dcm_01101]	
Parent Container	DcmDspSecurity	
Description	Delay, in seconds, from startup (measured from the first call of the Dcm_MainFunction()), allowed for all AttemptCounter values to be obtained from the Application. Must be a multiple of the DcmTaskTime. min: A value equal to the DcmTaskTime	
Multiplicity	1	
Type	EcucFloatParamDef	
Range	[0 .. 65535[
Default Value		
Post-Build Variant Value	false	

Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: local		

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDspSecurityRow	0..31	Definition of a single Row of configuration for security level configuration (per security level) The name of this container is used to define the name of the R-Port through which the DCM accesses the interface SecurityAccess_{SecurityLevel}. The R-Port is named SecurityAccess_{SecurityLevel} where {SecurityLevel} is the name of the container DcmDspSecurityRow. If there is no reference, no check of security level shall be done.

Figure 10.53: DcmDspSecurity configuration overview

10.2.5.19.2 DcmDspSecurityRow

SWS Item	[ECUC_Dcm_00759]
----------	------------------

Container Name	DcmDspSecurityRow		
Parent Container	DcmDspSecurity		
Description	Definition of a single Row of configuration for security level configuration (per security level) The name of this container is used to define the name of the R-Port through which the DCM accesses the interface SecurityAccess_{SecurityLevel}. The R-Port is named SecurityAccess_{SecurityLevel} where {SecurityLevel} is the name of the container DcmDspSecurityRow. If there is no reference, no check of security level shall be done.		
Configuration Parameters			

Name	DcmDspSecurityADRSIZE [ECUC_Dcm_00725]		
Parent Container	DcmDspSecurityRow		
Description	Size in bytes of the AccessDataRecord used in GetSeed		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	1 .. 4294967295		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILe, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	—	
Scope / Dependency	scope: local		

Name	DcmDspSecurityAttemptCounterEnabled [ECUC_Dcm_01050]		
Parent Container	DcmDspSecurityRow		
Description	This configuration parameter controls the existence of the APIs to set / get the attempt counter values towards application (Xxx_SetSecurityAttemptCounter() / Xxx_GetSecurityAttemptCounter()). In case of enabled, the security attempt counter values are passed to application, whenever there is a change in the value. This allows storing the values in nonvolatile RAM and restoring them at ECU startup.		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default Value			
Post-Build Variant Value	false

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDspSecurityRow	0..31	Definition of a single Row of configuration for security level configuration (per security level) The name of this container is used to define the name of the R-Port through which the DCM accesses the interface SecurityAccess_{SecurityLevel}. The R-Port is named SecurityAccess_{SecurityLevel} where {SecurityLevel} is the name of the container DcmDspSecurityRow. If there is no reference, no check of security level shall be done.

Figure 10.54: DcmDspSession configuration overview

10.2.5.19.4 DcmDspSessionRow

SWS Item	[ECUC_Dcm_00767]
Container Name	DcmDspSessionRow
Parent Container	DcmDspSession
Description	This container holds all parameters needed to configure a single session
Configuration Parameters	

Name	DcmDspSessionForBoot [ECUC_Dcm_00815]		
Parent Container	DcmDspSessionRow		
Description	This parameter defines whether this diagnostic session allows to jump to Bootloader (OEM Bootloader or System Supplier Bootloader) and determines, from which unit the final response will be sent. If this diagnostic session doesn't allow to jump to Bootloader the value DCM_NO_BOOT shall be chosen.		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	DCM_NO_BOOT	This diagnostic session doesn't allow to jump to Bootloader.	
	DCM_OEM_BOOT	This diagnostic session allows to jump to OEM Bootloader and bootloader sends final response.	
	DCM_OEM_BOOT_RESP_APP	This diagnostic session allows to jump to OEM Bootloader and application sends final response.	
	DCM_SYS_BOOT	This diagnostic session allows to jump to System Supplier Bootloader and bootloader sends final response.	
	DCM_SYS_BOOT_RESP_APP	This diagnostic session allows to jump to System Supplier Bootloader and application sends final response.

10.2.5.22 DcmDspPeriodicTransmission

SWS Item	[ECUC_Dcm_00957]		
Container Name	DcmDspPeriodicTransmission		
Parent Container	DcmDsp		
Description	This container contains the configuration (parameters) for Periodic Transmission Scheduler.		
Configuration Parameters			

Name	DcmDspMaxPeriodicDidScheduler [ECUC_Dcm_00962]		
Parent Container	DcmDspPeriodicTransmission		
Description	Defines the maximum number of periodicDataIdentifiers that can be scheduled concurrently.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	1 .. 255		

Default Value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: local		

Name	DcmDspPeriodicTransmissionFastRate [ECUC_Dcm_00960]		
Parent Container	DcmDspPeriodicTransmission		
Description	<p>This parameter give the transmission rate of the requested periodicDataIdentifiers to be used if the parameter transmissionMode given in the ReadDataByPeriodicID request is equal to 0x03 ("sendAtFastRate"). This parameter value in seconds have to be configured as a multiple of DcmTaskTime.</p> <p>min: A negative value and zero is not allowed.</p>		
Multiplicity	0..1		
Type	EcucFloatParamDef		
Range	[1E-4 .. 1]		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	-	
	Post-build time	-	
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL, VARIANT-POST-BUILD
	Link time	X	VARIANT-LINK-TIME
	Post-build time	-	
Scope / Dependency	scope: local		

Name	DcmDspPeriodicTransmissionMaxPeriodicFastTransmissions [ECUC_Dcm_01182]		
Parent Container	DcmDspPeriodicTransmission		
Description	Defines the maximum number of periodic connections used for fast transmission.		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	0 .. 255		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		

Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: local		

Name	DcmDspPeriodicTransmissionMaxPeriodicMediumTransmissions [ECUC_Dcm_01181]		
Parent Container	DcmDspPeriodicTransmission		
Description	Defines the maximum number of periodic connections used for medium transmission.		
Multiplicity	0..1		
Type	EcclIntegerParamDef		
Range	0 .. 255		
Default Value			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants

10.2.5.23 DcmDspClearDTC

SWS Item

[ECUC_Dcm_01064]

Container Name	DcmDspClearDTC
Parent Container	DcmDsp
Description	This container contains the configuration for the Clear DTC service.
Configuration Parameters	

Name	DcmDspClearDTCCheckFnc [ECUC_Dcm_01066]		
Parent Container	DcmDspClearDTC		
Description	Callback function for condition check, manufacturer / supplier specific checks on the groupOfDTC, which is requested to clear. This parameter is related to the interface : Xxx_ClearDTCCheckFnc.		
Multiplicity	0..1		
Type	EcucFunctionNameDef		
Default Value			
Regular Expression			
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants

10.2.6 DcmGeneral

SWS Item	[ECUC_Dcm_00822]
Container Name	DcmGeneral
Parent Container	Dcm
Description	Contains general configuration parameters valid for the entire Dcm module.
Configuration Parameters	

Name	DcmDDIDStorage [ECUC_Dcm_00971]		
Parent Container	DcmGeneral		
Description	This configuration switch defines, whether DDDID definition is stored non-volatile or not. true: DDDID are stored non-volatile false: DDDID are only maintained volatile		
Multiplicity	0..1		
Type	EcucBooleanParamDef		
Default Value	false		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	

Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: local		

Name	DcmDevErrorDetect [ECUC_Dcm_00823]		
Parent Container	DcmGeneral		
Description	Switches the development error detection and notification on or off. <ul style="list-style-type: none"> • true: detection and notification is enabled. • false: detection and notification is disabled. 		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default Value	false		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: local		

Name	DcmEnableSecurityEventReporting [ECUC_Dcm_01187]		
Parent Container	DcmGeneral		
Description	Switches the reporting of security events to the IdsM: - true: reporting is enabled. - false: reporting is disabled.		
	Tags: atp.Status=draft		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default Value	false		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Scope / Dependency	scope: ECU		

Name	DcmHeaderFileInclusion [ECUC_Dcm_01019]		
Parent Container	DcmGeneral		
Description	Name of the header file(s) to be included by the Dcm module containing the used C-callback declarations.		
Multiplicity	0..*		
Type	EcucStringParamDef		
Default Value			

Regular Expression	[a-zA-Z0-9_](a-zA-Z0-9_.)*		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants

10.3 Protocol Configuration Example

Figure 10.63: Examples of protocol configuration with focus on buffer / DcmPduld settings

Above example shows protocol configuration at the use cases examples **OBD** and **UDS** (used for customer enhanced diagnosis). It is assumed that for **UDS** communication, there are functional and physical requests. There will be separate DcmPduRxIds for functional and physical reception.

Concerning buffer configuration it is proposed to use a separate buffer for the functional requests. This in correspondence to support the keep alive logic with functional addressed TesterPresent commands.

It is also proposed to use a separate receive buffer for the [OBD](#) commands. This in reference to support the protocol switch functionality.

It is allowed to share for both protocols the transmit buffer. Please note: The [DcmDsl-ProtocolRx](#) has two possible configurations:

- functional
- physical

The physical shall have a 1:1 (or 1:0) dependency to the [DcmDslMain-Connection](#). (which means: [DcmDslProtocolRxPduRef](#) in combination DCM_PROTOCOL_RX_ADDR_TYP = physical can exist only once per "Module") The functional shall have a 1:n dependency to the [DcmDslMain-Connection](#). (which means: [DcmDslProtocolRxPduRef](#) in combination DCM_PROTOCOL_RX_ADDR_TYP = functional can exist several times per "Module") The [DcmDslProtocolTx](#) shall exist only once per "Module"

10.4 Published Information

For details refer to the chapter 10.3 "Published Information" in SWS_BSWGeneral [7].
